DIRECTING COMMITTEE

Dr. Henry B. Collins, Smithsonian Institution, Chairman.

Dr. Burton W. Adkinson, Head, Office of Science Information Service, National Science Foundation.

Miss Moira Dunbar, Defence Research Board of Canada.

Mr. Robert C. Faylor, Arctic Institute of North America, Washington, D.C.

Mr. Robert C. Gooch, Director, Administrative Department, Library of Congress.

Dr. Jack C. Haldeman, Department of Health, Education, and Welfare.

Representative, Department of the Army.

Representative, Department of the Air Force.

Representative, Office of Naval Research, Department of the Navy.

Dr. A. L. Washburn, Dartmouth College, Hanover, N.H.

Dr. Walter A. Wood, Arctic Institute of North America, New York, N.Y.

FOREWORD

The purpose of the *Arctic Bibliography*, since its inception in 1947, has been to provide a key to scientific publications relating to the Arctic and sub-Arctic areas and to low temperature conditions available in the principal libraries of the United States and Canada, to assemble and systematize this material so that it may be readily available to scientists and others concerned with problems of northern research and development. In continuation of this program, volume 9, like the preceding volumes of the Bibliography, has been prepared by the Arctic Institute of North America for the Department of Defense under a contract with the Office of Naval Research.

The work has been carried out under the direction of Marie Tremaine, who has served as Editor and Director of the project since its beginning. In previous years the *Arctic Bibliography* has been supported almost entirely by the Departments of the Army, Air Force and Navy. In the fiscal year 1959–60 the military contributions have been supplemented by grants from the National Science Foundation, the National Institutes of Health, the Defense Research Board of Canada, and the National Geographic Society.

Subjects receiving special emphasis in volume 9 include: Acclimatization; Birds; Body systems, human and other; Botany; Construction; Ecology, animal and plant; Economic and social conditions; Environmental effects of darkness, humidity, light, and low temperature on animals, man, and plants; Eskimos; Expeditions, especially Russian; Fisheries and fishes; Forests and forestry; Geology; Growth and development; Hypothermia; Ice and ice conditions; Insects; Low temperature effects on aircraft, construction materials, lubricants, metals, motorized equipment,

rubber, etc.; Meteorology; Mineralogy; Oceanography; Physiology; Snow.

Of the 7,192 publications abstracted in this volume, 3,170 are in English, 2,548 in Russian (a marked increase over other years), 790 in Swedish, Norwegian, and Danish, 338 in German, and 346 in other languages. Over 90 percent of these publications are recent, 5,420 of them having appeared in 1957 and 1958, and 1,145 from 1950 to 1956.

The Directing Committee and the Arctic Institute wish to express their gratitude to the Librarian of Congress for continuing to provide working space for the project, to Miss Tremaine and the Bibliography staff who have prepared the volume, and to the military agencies and other organizations whose generous support has made the work possible.

Henry B. Collins
Chairman, Directing Committee
Arctic Bibliography

INTRODUCTION

The *Arctic Bibliography*'s ninth volume, the largest in the series to date, makes manifest* our effort to provide more informative abstracts, (5.4 abstracts per page, as compared with 6.3/page in vol. 4, and 6.7/page in vol. 1–2); also our effort to refine the index toward greater efficiency and economy.

Three modes of arranging the Bibliography were considered at its inception in 1947: by subjects, regions, or authors. The extent of the literature, also the interdisciplinary and interregional character of a good deal of it, decided the Directing Committee to favor the author arrangement, and, in view of its economy, to offer full citations and content notes. A regional arrangement in 69 sectors and a subject arrangement according to major disciplines were also provided, but with abridged citations. These ancillary arrangements were combined and intercalated with additional, topical listings to form an index of a rather composite nature. This pattern is maintained, and adapted to particular features of the successive volumes of the Bibliography, also to the new subject matter and geographic nomenclature in this rapidly changing area.

The increased role of government agencies, scientific institutions, congresses, etc., in the publication as well as the initiation of research is reflected in the increasing number of corporate authors in these volumes. As a rule, a conspectus of the entire publication is offered under the name of the institution as corporate author, and the contributions to it by individual scientists are abstracted under their names, so far as they can be ascertained.

A notable feature of volume 9 is the emergence of several Soviet institutions and serials devoted exclusively or extensively to northern research. The flood of Russian geological literature which

---

	v. 4	*v. 9*
*Total pages	1591	1599
Authors, pages	1204	1305
Items	7627	7192
Index, pages	387	294

has followed many years' thin trickle, includes the *Trudy*, *Informat͡sionnyĭ b͡iulleten'*, and *Sbornik statei po paleontologii* of the Institute of Geology of the Arctic in Leningrad. *Problemy Arktiki* appears again with two collections of articles a year beginning 1956. The Academy of Sciences' Commission on Problems of the North appears with its *Problemy Severa* and *Letopis' Severa*. The Academy's Kola, Karelian, Komi, and Yakut Branches with their *Izvestii͡a* and *Trudy* report work on soils, minerals, agriculture, and from the White Sea and Murmansk Biological Stations, on fisheries. The Botanical Institute's Vegetation of the far North series, the Permafrost Institute's *Trudy* and *Materialy*, all these and others indicate the multifarious activities in the Soviet North. One field of prime importance, is still but lightly reported from the U.S.S.R., namely medicine.

Among recent publications of use to a variety of specialists, attention should be drawn to statistical handbooks for the RSFSR, Komi A.S.S.R., Murmansk and Arkhangel'sk Provinces, to regional economic surveys of Chukotka by Gushchin and Afanas'ev, Khanty-Mansi National District by Kokosov and others, and of the Yakut A.S.S.R. by the Academy of Sciences' Institute of Economics; also to the new *Atlas of Canada*, to Dunbar and Greenaway's *Arctic Canada from the air*, and the new edition of *Geology and economic minerals of Canada* from the Canadian Geological Survey.

Considering the earlier material, H. H. Gran's plankton study, the Leningrad Hydrological Institute's *Issledovaniia morei SSSR* with works of Deri͡ugin, Gur'i͡anova, etc., and minor papers from Nares' expedition are among those completed for this volume. Earlier material probably will make up 5–10 percent of our program for some time to come and priority will be given to publications hitherto unavailable, the majority of foreign origin, to works cited as significant by current authors or requested by users of the Bibliography, and to background studies in subject fields lately introduced into it. Cooperative effort is needed to bring earlier foreign publications to attention. Scientists' requests and suggestions are valued by the editor, who takes this opportunity also to thank those so kind as to send reprints of their current papers.

ARCTIC BIBLIOGRAPHY

49087. A., V. [Akutskie muzykanty v Moskve. (Sovetskaia muzyka, Feb. 1958. god 22, no. 2, p. 155–57, illus.) Text in Russian. ***Title tr.:*** Yakut musicians in Moscow.

Describes guest appearances in Moscow of Yakut theatrical groups on the occasion of the 325th jubilee of Yakutia's annexation by Russia. Of particular interest was the performance of the first Yakut opera "N'urgun Bootur," written by the Yakut composer M. Zirkov, libretto by D. Sivtsev (Suorun Omollon). The high musical value of this opera, using characteristic Yakut folk tunes and based on the "olonkho" heroic folk epos, is discussed. The names of performers, directors, etc., are listed. ***Copy seen:*** DLC.

49088. AAGESEN, AAGE. Das Wirtschaftsleben Grönlands. (Geographische Rundschau, Sept. 1958. Jahrg. 10, Heft 9, p. 348–53, map.) Text in German. Edited by Wolf Tietze. ***Title tr.:*** Greenland's economic life.

Discusses the natural especially climatic conditions, distinguishing subarctic, arctic and high arctic zones; population development, hunting, trapping, fishing, and sheep and reindeer breeding are reviewed; the rise of agriculture and exploration of natural resources are noted, also the growth of air transportation. Five economic regions are characterized: Julianehåb, Godthåb, Disko Bugt, the Nugssuaq Peninsula, and the east coast; the first two considered the most promising. Fisheries, stock (cattle) raising, agriculture, mining, and industry are the important branches of the economy for the future. ***Copy seen:*** DLC.

49089. ÅHLIN, K. Isfri ränna med komprimerad luft. (Svenska vägföreningen. Tidskrift, Mar. 1954. årg. 41, häfte 2, p. 76–77, illus.) Text in Swedish. ***Title tr.:*** Ice-free channels by use of compressed air.

Use of plastic pipe of one-and-half inch diam., with 75 mm. holes at 10 m. intervals, has been found feasible and economical to maintain ferry channels over Swedish lakes in winter. The method depends on overturning of warmer water from lower levels in the lake and is most successful in still water at least 10 m. deep. A compressor with 2m.³/min. capacity maintained a 900 m. channel 10–15 m. wide. In northern Sweden winter traffic is usually over the ice, although this road maintenance is expensive. ***Copy seen:*** DLC.

49090. ÅLESUND, Norway. Ålesund 100 år, 1848–1948. Utg. av Reklamekomitéen for Ålesunds 100-års jubileum. Ålesund, 1948? 55 p. 121 illus., map. Text in Norwegian. ***Title tr.:*** Ålesund centennial, 1848–1948. Published by the Advertising Committee for Ålesund's centennial.

Photographs of the city and environs, its fishery (cod, herring), sealing, boatbuilding, textile and other industries, community activities, etc., accompanied by brief text. This island seaport (62°28′ N. 6°8′ E.) is a base for arctic fishing ventures from Svalbard to West Greenland. Fifty years of sealing by Ålesund vessels was celebrated in 1948 also, they brought back half of the Norwegian catch for that year.

Copy seen: DLC.

49091. AALTONEN, VIKTOR TOIVO, 1889–1955. Boden und Wald, unter besonderer Berücksichtigung des nordeuropäischen Waldbaus. Berlin, Paul Parey, 1948. 457 p. illus., graphs, tables. Approx. 800 refs. Text in German. ***Title tr.:*** Soil and forest, with particular consideration of north European silviculture.

Detailed review of the literature on the influence of geology, geography, and climate upon soil and forest, and of the latter

upon one another. Emphasis is on conditions in Fennoscandia. Physical, chemical, and biological soil characteristics are related to the forest, undergrowth, litter, water, temperature, porosity, and aeration. The mineral, organic, and biological content of soils, their chemical reaction, changes resulting from vegetal cover, leaching and burning over, are evaluated with respect to determination of forest increment. The varying effects on soil of forest succession, competition, stand, and fertilization are analyzed. Soil and forest classifications developed in Finland, Sweden, and Norway are outlined. In modern practice they are scientifically integrated in making silviculture one of the region's chief economic activities. ***Copy seen:*** DLC.

49092. AALTONEN, VIKTOR TOIVO, 1889–1955. De finska skogstyperna i markforskningens ljus. (Svenska skogvårdsföreningen. Tidskrift, 1951. årg. 49, nr. 3, p. 228–42, illus., tables, graphs.) Text in Swedish. ***Title tr.:*** Finnish forest types from the soil-research viewpoint.

Summarizes information, from research studies and state surveys, on the relationship between different characteristics of the soil (physical properties, depth of humus layer and the A horizon, chemical and microbiological properties), and the occurrence of Cajander's forest types in Finland. ***Copy seen:*** DA.

49093. AASBØ, KNUT. Glimt fra noen finske og svenske gruver. (Tidsskrift for kjemi, bergvesen og metallurgi, 1956. årg. 16, nr. 2, p. 34–40, cross-sections, diagrs., graph.) 14 refs. Text in Norwegian. ***Title tr.:*** Glimpses of some Finnish and Swedish mines.

Describes visit to several Finnish and Swedish mines, including Malmberget, Luossavaara and Kiirunavaara. Nature of the orebodies, characteristics of deposition, types of machinery, and methods of ore removal are reviewed. The use of warm compressed air to prevent freezing of drills is noted; personnel accommodations described. ***Copy seen:*** DLC.

49094. AASEN, OLAF. Norwegian herring investigations in the Norwegian Sea 1956. (International Council for the Study of the Sea. Annales biologiques 1956, *pub.* 1958. v. 13, p. 176–78, tables, maps.)

Includes information on fish-location activities, length and age distribution of catches, predominant year-class, distribution of maturity stages, location of herring approaching the coast for spawning. ***Copy seen:*** DI.

49095. AASGAARD, GUNNAR, 1888– . Store Norske Spitsbergen Kulkompani A/S. (Tidsskrift for kjemi, bergvesen og metallurgi, Mar. 1950. årg. 10, nr. 2B, p. 122–26, map, illus., tables.) Text in Norwegian. ***Title tr.:*** The Great Norwegian Spitsbergen Coal Company, Ltd.

Describes the coal mines at Longyearbyen, 78° N. 1000 km. north of Tromsø, Norway, and reviews their history and operation, the climate, navigation, and post-war construction. Quality of the coal assures it a competitive position in the open market despite high production costs. Two mining (and one management) shifts daily are used in operation of the main drift; 3 tons/man/day are produced. Coal is transported from the mine by a cableline with a 100 ton/hour capacity to a quay 6 km. away with 150,000 tons storage capacity and accommodation for ships up to 11,000 tons. Post-war shipments to Norway have exceeded 1 million tons and 1947–1949 operations showed a profit. Coal composition and production figures are tabulated. ***Copy seen:*** DLC

49096. AASGAARD, GUNNAR, 1888– . Svalbard og kulldriften der. (Tidsskrift for kjemi, bergvesen og metallurgi, Feb. 1951. årg. 11, nr. 2, p. 23–30, illus., map, profiles.) Also pub. in Teknisk ukeblad. Mar. 1951, årg. 98, nr. 12, p. 223–30. Text in Norwegian. ***Title tr.:*** Svalbard and the coal mines there.

Reviews the history of this industry and geology of the coal. Variations in quality and grade of seams from middle and upper Devonian, Cretaceous and Tertiary deposits of Spitsbergen and upper Devonian coal in Bjørnøya are discussed in relation to specific mines. Composition and age of the coal, nationality of the operator, annual tonnage and number of personnel are tabulated for each mine. ***Copy seen:*** DLC.

49097. ABASHKINA, A. V. Novye vidy korallov *Lithostrotion* iz verkhnevizeĭskikh otlozheniĭ Severnogo Urala i ikh stratigraficheskoe raspredelenie. (Moskovskoe obshchestvo ispytateleĭ

prirody. Bûlleten', nov. seriâ, god 129, t. 63, otdel geologicheskiĭ, Nov.–Dec. 1958. t. 33, vyp. 6, p. 137–49, illus., tables.) 13 refs. Text in Russian. ***Title tr.:*** New species of *Lithostrotion* corals from upper-Visean deposits of the Northern Ural and their stratigraphic distribution.

Describes Lower Carboniferous (-Mississippian) *Lithostrotion* and *Diphyphyllum* corals in collections from the upper and middle Pechora River basin (approx. 62°–65° N. 56°–58° E.). The stratigraphic position of these corals (listed) is outlined. The new species: *L. amplexocariniaformis, L. complexocolumellata,* and *L. breviseptata,* are fully described and illus. in photos. ***Copy seen:*** DLC.

49098. ABBOU, R., *and* **M. VALLIÈRE.** Étude de l'action hypoglycémiante de l'insuline au cours de l'hypothermie provoquée par réfrigération externe. (Société de Biologie, Paris. Comptes rendus 1956. t. 150, no. 10, p. 1697–1700, illus. table.) 4 refs. Text in French. ***Title tr.:*** Study of the hypoglycemic action of insulin during hypothermia induced by external cooling.

A study of rabbits with normal and mildly depressed temperature (33°, and 27° C.) and glycemia produced spontaneously and under the action of insulin. Under the conditions of the experiment, the hypoglycemic action of insulin did not manifest itself in the usual way: if it became apparent, it did so slowly, when the animals recovered from direct refrigeration. ***Copy seen:*** DNLM.

49099. ABEL, HERBERT, *and* **H. JESSEN.** Kein Weg durch das Packeis; Anfänge der deutschen Polarforschung, 1868–1889. Bremen, C. Schünemann, 1954. 87 p. illus., port., maps. (Schriften der Wittheit zu Bremen, Reihe D: Abhandlungen and Vorträge, Bd. 20 [i.e., 21] Heft 1.) 14 refs. Text in German. ***Title tr.:*** No way through the pack ice; beginnings of German polar exploration 1868–1889.

An account suggested by the discovery of new materials on this period in the archives of the Geographische Gesellschaft in Bremen. It deals with August Petermann's early efforts and final success in organizing a (first) German arctic expedition; with the preliminary or reconnaissance trip May–Sept. 1868, on the *Grönland,* (called *Germania* by Petermann), Karl Koldewey in command, its aim, the voyage up to the East Greenland pack ice and return (cf. No. 9021). Activities toward another attempt: the Second German North Polar Expedition, also under Koldewey, with the *Germania* and *Hansa,* June 1869 to Sept. 1870; loss of the *Hansa,* voyage of the *Germania* as far as Franz Joseph Fjord on the East Greenland coast (73°11′ N.), and return (cf. No. 5626). The expedition is evaluated; smaller summer trips to the Arctic Ocean in 1869–1871 are also described; efforts for further advances to the North, and abandonment of large-scale exploration are discussed. This account is concerned with organizational matters, the mounting of the expeditions rather than the course of the explorations or their results. ***Copy seen:*** DLC.

49100. ABELSEN, KNUD. En grønlaender ser på den ny tid. (Grønland, Nov. 1958. nr. 11, p. 423–30, illus.) Text in Danish. ***Title tr.:*** A Greenlander looks at the new era.

General survey, by a district judge, of development in local government, local policy, administration of justice, cultural work, etc., with comments.

Copy seen: DLC.

49101. ABRAHAMS, *Sir* **ADOLPHE.** Diet and clothing in winter. (Practitioner, Dec. 1957. v. 179, no. 1074, p. 685–88.)

Discusses function of clothing; variability in sensitiveness to cold; materials and fabrics for winter garments, both outer and under clothing; protection of hands and feet; hats and caps; food.

49102. ABRAHAMSON, SHERMAN RAYMOND, 1920– . Geography of the Naknek region, Alaska. Worcester, Mass., Clark University, 1949. 148 p. 49 illus., 16 diagrs., 16 maps incl. 4 fold. Typescript. Ph. D. dissertation. 29 refs.

The Naknek region is a representative portion of the Naknek-Nushagak lowland approx. 58°40′ N. 157° W., in southwestern Alaska, north and east of Bristol Bay; it separates the Alaskan-Aleutian ranges on the east from the Ahklun Mts. on the north and west. The geography is described and mapped, with consideration of the geology, two stages of glacial activity, climatic data, vegetation, and permafrost. Typical keys for represent-

511326—60——2

ing these were developed with the aid of aerial photographs. Plant species from eight communities are identified.

Copy seen: MWC.

49103. ABRAMOV, L. T., *and* **N. V. ZAMORINA.** Osennīĭ remont i podgotovka osushitel'noĭ seti na aėrodromakh k zimneĭ konservat͡sii. (*In:* U.S.S.R. Armiĭa. Upravlenie voenno-vozdushnykh sil. Sbornik materialov po stroitel'stvu . . . aėrodromov. Moskva, 1942. vyp. 1, p. 69–73.) Text in Russian. ***Title tr.:*** Fall maintenance of airfield drainage system for winter preservation.

"Procedures are suggested for the maintenance of drainage systems for airfields using grass runways. Maintenance work should be completed before the first freeze and snowfall. It is recommended that open drainage facilities be cleared, sodded, and equipped with reinforced sides of rock and wood wherever the grade ranges from 3 to 5 m./km. Closed drainage systems should be checked for plugs to prevent flooding sections of the airfield during the spring run-off."—SIPRE. ***Copy seen:*** DLC.

49104. ABRAMOV, R. V. Nishi vytaivaniĭa. (Priroda, July 1957, no. 7, p. 112–13, 2 illus.) Text in Russian. ***Title tr.:*** Undercutting due to thawing.

"Bank erosion along the lower Lena River associated with the thawing of permafrost and destructive action of the river water is described. These processes occur along banks consisting of frozen sand, and reach a maximum intensity near the end of summer, when the active layer (about 1.5 m. thick) thaws completely. The cohesive strength of the warming frozen strata becomes insufficient to prevent collapse of the undercut banks with their vegetation, trees, etc."—SIPRE. ***Copy seen:*** DLC.

49105. ABRAMOV, V. F., *and others.* Sravnitel'naĭa o͡tsenka otboĭki rudy glubokimi skvazhinami na apatitovom rudnike. (Gornyĭ zhurnal, May 1958, no. 5, p. 10–14, illus., table.) Text in Russian. *Other authors:* D. R. Kaplunov, *and* O. A. IÀkovlev. ***Title tr.:*** Comparative evaluation of ore breaking in apatite mines by deep bored wells.

Geological characteristics of apatite-nepheline deposits in the Kirov mines in Kola Peninsula are described. The conventional blasting method was found inconvenient because of the large amount of shattering and the removing of crushed ore along narrow passages; a new method, producing larger blocks by placing the charges at greater depth, is introduced. Boring equipment and arrangement of explosives' chambers, etc., are described and illus. Comparative production data for the two methods are tabulated.

49106. ABRAMOVA, V. D. Plankton kak indikator vod razlichnogo proiskhozhdeniĭa v morĭakh Severnoĭ Atlantiki. (Murmansk. Polĭarnyĭ nauchno-issledovatel'skiĭ institut morskogo rybnogo khozĭaĭstva i okeanografii. Trudy, 1956. vyp. 9, p. 69–92, illus. tables, maps.) 25 refs. Text in Russian. ***Title tr.:*** Plankton as indicator of waters of different origin in the North Atlantic seas.

A study of the effects of temperature and currents on the quantitative and qualitative distribution of the plankton, based on collections made during spring and summer of 1953 and compared with such of 1951 and 1952. Main forms characteristic of certain environments are determined and used as indicators of the hydrological regime of the area. Fundamentally two groups were discerned: cold-water and warm-water forms. Their frequency, occurrence or intermingling is indicative of water masses, their movements, the cold water front, etc. Qualitative analysis of the plankton also revealed annual fluctuations in its composition. ***Copy seen:*** DI.

49107. ABRAMSON, DAVID I., *and others.* Relationship between a range of tissue temperature and local oxygen uptake in the human forearm, 1; changes observed under resting conditions. (Journal of clinical investigation, July 1958. v. 37, no. 7, p. 1031–48, illus. tables.) 10 refs. *Other authors:* A. Kahn, S. Tack, *Jr.*, G. A. Turman, H. Rejal, *and* C. J. Fleischer.

Account of investigations on 17 healthy volunteers, aged 17–41 years, with the superficial temperature of the arm raised (by a bath) to 39° C. or lowered to 35.4° and 26.9° C. Raising the local temperature increased the resting oxygen uptake while lowering it reduced the uptake. The results are in line with *in vitro* studies of tissue strips and with conditions during general hypothermia. Part 2 of this series does not deal with lowered temperatures. ***Copy seen:*** DLC.

electrode crevasse detector. (American Geophysical Union. Transactions, Dec. 1957. v. 38, no. 6, p. 849–56, illus., tables, diagrs.)

"Analyses based on general electromagnetic field equations were undertaken, but these proved tractable only for rather simple cases not extending to the presence of a cavity. After a study indicated magnetic induction effects to be negligible, analysis of the electrostatic field led to an expression for the potential at any point in the field, with allowance for the presence of a spherical or cylindrical cavity. A numerical solution of the Laplace equation afforded another technique, using the Southwell relaxation method. A third approach was to model the problem in a plane using conducting paper to obtain an analog solution. The analog technique was found to be the most expeditious one, and it is flexible as to the shape of the cavity cross-section. Specimen curves and tables are given."—Author's abstract. ***Copy seen:*** DLC.

Alkaline bedrocks, only recently considered economically important, are found in Scandinavia, the Kola Peninsula, Greenland, Canada, the Urals, western Siberia and elsewhere, in locations of tectonic activity within the continental blocks, where they are Precambrian to Permian in age. These rocks, commonly called nepheline syenites, have been divided into four groups, according to variations in mineral content, by Russian geologists whose quantitative diagram is reproduced. The rocks are an important source of nepheline-feldspar concentrates, of economically important minerals such as apatite and barite, and as a source of niobium, titanium, strontium and other, related minerals. Their use in the glass, ceramic, and fertilizer industries are briefly noted. The Khibiny and Lovozero deposits of the Kola Peninsula, the largest known, are described. The known reserve of two billion tons is being mined near Kirovsk, with annual pre-war production reaching two million tons. One of the small deposits known in Norway is at 70° N. on the island of Seiland.

Reports results of experiments carried out in 1955, spreading the soil surface with peat, soot or chalk. The effect of color on soil temperature at 0–40 cm. depth, on the amount of NO_3, NH_4, P_2O_5, K_2O, and N, in the soils, also on oats grown in them, is presented in tables. Light gray soils of the far North when colored with soot or powdered peat were found to absorb more solar heat energy than do soils of natural color. Darker color provides conditions for a more active mobilization of nutrient elements in the soil. Hence much more nitrates, ammonia, available phosphorus and potassium were found in soils of dark-colored plots, than on the non-colored ones. The intake of nutrient elements at different phases of plant growth proceeded at a higher rate on the darkened than on the control plots.

49123. ÄYRÄPÄÄ, AARNE ELIAS, 1887– . Skifferspetsarna i östra Fenno-Skandien. (Suomen muinaismuistoyhdistys. Suomen museo, 1950. v. 57, p. 9–43, illus., map.) Approx. 50 refs. Text in Swedish. Summary in German. ***Title tr.:*** Slate points in eastern Fennoscandia.

Occurrences of several types of slate tools are related to post-glacial geological changes of level and to Russian and Scandinavian finds. Two groups of slate weapons found in Finland, including Finnish Lapland and eastern Finnmark, are discussed in detail: the leaf-shaped spear points and knife blades belonging to the pre-ceramic Suomusjärvi culture (5500–3000 B. C.) and the so-called daggers, variously shaped blades and asymmetrical, three-edged, barb-less arrow points attributed to the later phase of the comb-ceramic period (latter part of the third millenium B. C.). The sites of slate implement finds are indicated on map and the extensive stone age cultural exchanges in northern Finland, Sweden and Norway noted. The problem of a Finnish or Scandinavian origin of the slate industry is speculated upon.

49129. AGER, BENGT H:SON. Packad snö som transportunderlag. (Norrlands skogsvårdsförbund. Tidskrift, 1956. no. 3, p. 293–384, illus. tables, graphs, diagrs.) Text in Swedish. Summary in English. ***Title tr.:*** Compacted snow as a base for traffic.

"The results of field experiments on the bearing capacity of snow processed by various methods and its variations under varying conditions and various vehicles are reported; the measurement and test methods are described and evaluated; and detailed data are tabulated. Compacted snow was measured for hardness, density in the upper 0–10 cm., and temperature; and the max. drawbar pull of vehicles at standstill as well as sled resistance were studied. The highest bearing strength was obtained by using a rotary tiller and a sliding pontoon, making the road trafficable for light-wheeled tractors 24 hr. after processing. The density and hardness of the upper snow layer increased with time after compaction if the roadbed was kept free of traffic, a fact which is attributable to moisture migration from the ground and lower snow layers. Once the road was used, its bearing strength was determined by traffic. The noted decrease in hardness of the bottom layer resulting from the moisture transport was not great enough to adversely affect the bearing strength of the road, provided the snow had been thoroughly mixed and processed. Studies of various antiskid devices in relation to drawbar-pull tests showed that the best antiskid device with an extra load of 750 kg. gave a pull about

three times greater than a conventional antiskid device without extra load."—SIPRE. ***Copy seen:*** DA.

49130. AGER, BENGT H:SON. Den snöpackade vägen; II, väderlekens betydelse. (Svenska skogsvårdsföreningen. Tidskrift, 1955. årg. 53, p. 200–230, illus., graphs.) 13 refs. Text in Swedish. Summary in English. Reprinted as Föreningen skogsarbeten och Kungl. domanstyrelsens arbetsstudieavdeling. Meddelande nr. 54, 1955. ***Title tr.:*** The snow-compacted road; II, the importance of weather.

The theory of the freezing process in roads is discussed on the basis of measurements. Temperature and radiation are of primary importance; atmospheric humidity and wind (except when drifting occurs) of secondary importance. Even a thin layer of fresh snow insulates the road from atmospheric influence. Prior to (or during) passage of a warm front usually followed by fresh snowfall, compaction should be avoided. If the fresh snow is left for 24–48 hrs., transport can begin within 24 hrs and without further treatment. ***Copy seen:*** DA.

49131. AGRANAT, GRIGORIĬ ABRAMOVICH. Sovremennyĭ Labrador. (Problemy Severa, 1958, vyp. 1, p. 244–56, map.) 12 refs. Text in Russian. ***Title tr.:*** The Labrador of today.

Outlines recent economic development of the northern Quebec-Labrador peninsula: discovery of abundant iron ore deposits and their exploitation; discovery and utilization of titanium ores; plan for a hydroelectric plant on the Hamilton River at Grand Falls; impact on the economy expected from the St. Lawrence Seaway; fisheries, hunting and trapping; vegetable growing and stock raising; growth of population. Rise of new branches of the economy and decline of old ones (fisheries and hunting) are stressed; a slow growth rate is noted in the population generally and a decrease in the native population. This paper is based chiefly on Canadian publications. ***Copy seen:*** DLC.

49140. AIKEN, EDWIN G. Response acquisition and reversal under cold stress. Nov. 16, 1956. 10 p., illus., tables. (U.S. Army Medical Research Laboratory, *Fort Knox, Ky.* Project no. 6–95–20–001. Report no. 277.) 15 refs.

Report on psychological response tests applied to 40 normal subjects. Performance and level of task learning during cold were not significantly affected either during acquisition of the original response or during tests for response interference. However, interference was

acquired under conditions of low temperature. ***Copy seen:*** DNLM.

49141. AIMERS, DOUGLAS. To hook a halibut. (Alaska sportsman, June 1958. v. 24, no. 6, p. 22, 28–29, illus.)

Describes halibut fishing gear formerly used by Northwest Coast Indians. Hooks were made of yew lashed to cedar on which a barb of bone or iron was fastened, and baited with flesh of octopus legs. Lines were made of cedar fiber, animal sinews or intestines. ***Copy seen:*** DI.

49142. AĬNANA, LIŪDMILA. Solnt͡se vzoshlo nad tundroĭ; otkrytoe pis'mo kanadskomu zhurnalistu Dzhonu Stiū-artu. (Smena, May 1958. god 35, no. 10, p. 4, illus.) Text in Russian. ***Title tr.:*** The sun has risen over the tundra: an open letter to the Canadian journalist, John Stuart (Stewart?).

By an Eskimo girl, a student in the Dept. of Northern Peoples at the Gert͡sen Pedagogical Institute in Leningrad: she lauds the progress of acculturation and economic development of Eskimos and other northern peoples of the Soviet Union; their advantages are contrasted with poor conditions among the Canadian Eskimos. ***Copy seen:*** DLC.

AINSWORTH, J., *see* Lagow, H. E., *and others.* Rocket measurements . . . *1958.* No. 52624.

49143. *AIR FORCE.* Alaskan Air Command, top of the world guardian. (Air Force, Aug. 1958. v. 41, no. 8, p. 128–29, illus.)

Outlines missions of the AAC, which provides for the air defense of Alaska and the northwest arctic approaches to the United States, maintains a radar warning (AC & W) and communications (White Alice) system, and a "launching platform" for retaliatory attacks at Eielson Air Force Base near Fairbanks; also, AAC supports the western segment of the DEW Line. Aircraft assigned to the Command include Convair F–102's, C–123 Providers, L–20 Beavers, "J" model Scorpions, and Vertol H–21 helicopters. Its participation in establishing IGY drift station (Project Ice Skate) and in cold-weather experimentation, etc., is noted. ***Copy seen:*** DLC.

49144. *AIRCRAFT.* A better radome. (Aircraft, July 1958. v. 20, no. 7, p. 55, illus.)

Describes frameless, reinforced epoxy radome developed for early-warning installations. It has 50 ft. base diameter and 55 ft. equatorial diameter, is 40 ft. high and weighs 9,000 lbs. It can be shipped disassembled in one C–124 or C–119 aircraft, and erected by six men in 1½ days. ***Copy seen:*** DLC.

49145. *AIRCRAFT.* The DEW air lift triumph or fiasco? (Aircraft, July 1956. v. 18, no. 7, p. 76–79, +, illus.) Reprinted from April 1956 issue of *Pilot,* official publication of the Canadian Air Line Pilots Association.

Criticizes the performance of Canadian air freight carriers participating in DEW line operations; government's employment of weak companies; neglect of aircraft safety requirements; rates (80 cents/ton-mile) for the hauls, etc.; use of obsolete, privately-chartered American aircraft and failure to utilize the Pilots Association membership, etc. Refutation is offered by George Marler, Minister of Transport. ***Copy seen:*** DLC.

49146. *AIRCRAFT.* DOT buys more Bells. (Aircraft, June 1958. v. 20, no. 6, p. 66.)

Notes purchase by the Canadian Dept. of Transport of four Bell 47J helicopters to be stationed on ice-breakers in arctic service. ***Copy seen:*** DLC.

49147. *AIRCRAFT.* Frobisher, a name to note. (Aircraft, Dec. 1957. v. 19, no. 12, p. 35, 80, illus.)

Reviews development of this airfield (63°28′ N. 67°23′ W.) on Baffin Island, now operated by the Department of Transport. Scheduled improvements include lengthening of the runway, a new 6,000 ft. taxi strip, offices, power station, etc. Several commercial companies use the airport in their transpolar flights. ***Copy seen:*** DLC.

49148. *AIRCRAFT.* The ice spotters. (Aircraft, Jan. 1958. v. 20, no. 1, p. 31–32, illus.)

Notes duties of helicopters based on the ice-breakers *d'Iberville* and *C. D. Howe* on arctic supply missions: ice reconnaissance, ship-to-shore ferry, transport of sick and injured personnel, etc. The Canadian Dept. of Transport has six Bell 47's. ***Copy seen:*** DLC.

49149. *AIRCRAFT.* PSC on arctic survey. (Aircraft, July 1958. v. 20, no. 7, p. 89)

Two B–17 aircraft of the Photographic Survey Corp. are photographing 220,000 sq. mi. of the eastern portion of the

Canadian Arctic Islands. Bases to be used in 1958 are Frobisher, Foxe, Resolute, Alert, and Thule.

Copy seen: DLC.

49150. ***AIRCRAFT.*** Sounding the skies. (Aircraft, Sept. 1957. v. 19, no. 9, p. 38, 40, illus.)

Contains brief description of the launching facilities for IGY Aerobee-Hi and Cajun rockets at Fort Churchill, Manitoba. A steel-framed, metal-covered building, 40 x 40 x 56 ft. high, is constructed to withstand 22,100 lbs. of thrust when the rocket is fired from inside through a revolving guiding tower in the roof; pressure escape is arranged by raising the metal panels forming the lower walls of the structure. A nylon tent is fitted loosely over the tower to permit heating of the building.

Copy seen: DLC.

49151. ***AIRCRAFT.*** Spartan flies high. (Aircraft, Aug. 1957. v. 19, no. 8, p. 26–27, 73–74, illus.)

Describes mapping and surveying activities of Spartan Air Services Ltd.: high-altitude (30,000 ft.) mapping, initiated in the Yukon and Mackenzie Districts in 1950 and later aided by the adaptation of Shoran, mineral search and use of the airborne magnetometer, profile recording by radar altimeter, search for radio-active ore using scintillation counters, and for non-magnetic ore using electromagnetometers. The company operates 50 aircraft and 33 helicopters, including modified Mosquito 35's for the high-altitude mapping. Search for nickel and copper deposits is to be conducted in the summer of 1957 over a 5,000 sq. mi. area from Cape Smith (60°44′ N. 78°29′ W.) across the Ungava Peninsula to Wakeham Bay (61°35′ N. 71°50′ W.). ***Copy seen:*** DLC.

49152. AĬZENSHTADT, A. Poĭût nanaĭtsy i ul'chi. (Sovetskaîa muzyka, Nov. 1957. god 21, no. 11, p. 88–93, illus.) Text in Russian. ***Title tr.:*** Gold and Tungus songs.

Describes the songs, mainly Nanai (Gold) folksongs, collected during author's one-man expedition sponsored by the Khabarovsk Palace of People's Art. The music, mood, tempo, content and folkloristic elements of the 65 old and new Nanai songs are discussed and some sample scores are given. The songs and music of the culturally and linguistically related Ul'chi (Tungus) are dealt with briefly. ***Copy seen:*** DLC

49153. AKADEMIÎA NAUK SSSR. Dmitriĭ Ivanovich Shcherbakov. Vstup. stat'îa V. V. Shcherbiny; bibliografiîa sostavlena K. V. Shpis. Moskva, Izd-vo Akademii nauk SSSR, 1958. 57 p. port. (Materialy k biobibliografii uchenykh SSSR. Seriîa geologicheskikh nauk, vyp. 13.) Refs. Text in Russian. ***Title tr.:*** Dmitriĭ Ivanovich Shcherbakov. Introduction by V. V. Shcherbina; bibliography by K. V. Shpis.

Contains sketch of the life and scientific activities of this geologist, Academician and Learned Secretary of the Dept. of Geology and Geography of the Academy of Sciences; followed by lists (chronological and alphabetic) of his publications to date. His participation in arctic explorations is indicated. ***Copy seen:*** DLC.

Moskva, Izd-vo Akademii nauk SSSR, 1957. 419 p. illus., tables, maps incl. fold. Over 250 refs. Text in Russian. ***Title tr.:*** History of Yakut A.S.S.R., v. 2; Yakutia from 1630 to 1917. In sequence to No. 36584. Prepared by a group of Yakut and Russian scientists: I. S. Gurvich, A. A. Izbekova, O. V. Ionova, M. A. Krotov, M. N. Martynov, M. M. Nosov, P. U. Petrov, F. G. Safronov, N. N. Stepanov, V. N. Chemezov, G. U. Ėrgis.

Exhaustive study of the economic and social development of Yakutia after annexation by Russia, in three main periods: Russian feudalism (17th–mid-18th centuries), decline of feudalism (1760–1860), and capitalism (1861–1917). The culture, economy and social organization of the aboriginals (Yakuts, Evenki-Tungus, Eveny-Lamuts, Yukaghirs, et al.) and of Russian settlers are dealt with. Administration and taxation (îasak), development of natural resources, agrarian and economic reforms are outlined. Political exiles, the Yakuts' early resistance to colonialism, and revolutionary movements of the 19-20th centuries are discussed. Ethnic distribution (17th century) and exploration routes are mapped and selected statistics on population, agricultural yields, taxation, etc., tabulated.

Anthology of 21 articles on the years of revolution and counter-revolution in Yakutia (1917–1919) written by eye-witnesses, mostly political exiles. Authors of the articles and titles (in English translation) are:

M. K. Ammosov: Birth of the February revolution.

I. N. Barakhov: October revolution in Yakutia.

K. E. Andreevich: The Yakut organization of the Russian social-democrat party and the food supply committee (1917).

G. O. Bashirov: Revolutionary youth and secret typography.

I. P. Rednikov: For the power of the Soviets.

D. S. Zhirkova: From the revolutionary past.

A. F. Popov: On the underground work in 1918.

P. A. Slepŝov-Ofunskiĭ: 1918.

A. S. Rydzinskiĭ: Excerpts from memoirs.

D. T. Bratash: March on Yakutsk, May–June 1918.

L. L. Danish: Memoirs.

S. I. Sviderskiĭ: My recollections.

E. M. Pshennikov: The peasants from Markha in 1918.

S. M. Arzhakov: The fight for Soviet power in the former Vilyuysk district.

I. I. Bochkovskiĭ: Communication personnel of Yakutia in 1918.

S. V. Vasil'ev: In the Irkutsk prison.

ÎA. K. Svinŝov: During the days of fight against the Kolchak movement.

A. E. Kugaevskiĭ: The Krasnoyarsk uprising.

P. P. Kochnev: The revolutionary fight for Soviet power in Yakutia.

B. M. Chizhik: The overthrow of the Kolchak movement in Yakutsk.

M. V. Megezhekskiĭ: The union of young communists. ***Copy seen:*** DLC.

49171. AKADEMIÎA NAUK SSSR. INSTITUT ÉKONOMIKI. Problemy razvitiîa promyshlennosti i transporta ÎAkutskoĭ ASSR. V. F. Vasiûtin, otv. redaktor. Moskva, Izd-vo Akademii nauk SSSR, 1958. 458 p. tables, maps (4 fold.). Refs. Text in Russian. ***Title tr.:*** The development of industry and transportation of the Yakut A.S.S.R. V. F. Vasiûtin, chief editor.

A collective study of the main branches of the economy of Yakutia, based on investigations by the Yakutia Expedition of the Institute of Economics of the Academy of Sciences in 1952–1955. The 17 chapters are prepared by S. V. Slavin (1 and 2), R. S. Livshiŝ (6), V. V. Varankin (11), M. A. Vilenskiĭ (9, 13, 17), G. I. Granik (15); L. M. Dudaeva (5), P. M. Zakonnikov (8), S. V. Mikhaĭlov (14), M. ÎA. Sonin (16), G. M. Chudinov (12), A. G. Omarovskiĭ and D. A. Baranov (10), G. V. Naumov (4), I. K. Efimov (3) and K. G. Kondakov (7). They deal with: features of the economic development (p. 6–15); premises for evaluating the outlook for economic development (p. 16–29); gold mining in the south (p. 30–39); developing diamantiferous deposits in the west (p. 40–62); the mica industry (p. 63–66); iron ores and coal deposits of the Aldan (p. 67–93); Olekminsk salt deposits (p. 94–118); fuel industry (p. 119–159); electric power (p. 160–210); metallurgy (p. 211–18); forestry (p. 219–71); the building materials industry (p. 272–92); consumers goods industry (p. 293–320); fisheries (p. 321–36); basic problems of transportation development (p. 337–419); problems of population and manpower (p. 420–40); economic zoning (p. 441–58). Progress achieved during the Soviet rule, the present-day situation and future prospects are discussed with data on resources, distribution, equipment, output and planned expansion of each main branch of industry, including six diamantiferous regions in northwest Yakutia (p. 46–52), 48 coal deposits (p. 120–32 and 138–44), the system of electric power supply, 22 forestry farms (leskhozy), seven fisheries plants (rybozavody), river (p. 340–77), motor and air transportation. The agricultural situation, work of collective and state farms, need for them to keep pace with industrial development are discussed. Population data are given: 283.9 thousand in 1926, 413.2 in 1939, rate of annual growth for 1945–54: 13.4 per thousand in 1948, 24.0 in 1953; acute shortage of manpower affects all branches of industry. Cartographic material includes: the 35 administrative districts and their centers (insert between p. 12–13), coal deposits, approx. 20 north of the Arctic Circle (p. 124–25), distribution of forestry farms, five in the far North (p. 224), freight transport in 1952 on the Lena, Aldan and Vilyuy Rivers (p. 356–57), the transportation system (p. 385), and (p. 421) the population density.

Title tr.: Soviet mining science, 1917–1957. N. V. Mel'nikov, editor.

Collective work, a score of papers, presenting a comprehensive account of the development of mining institutions, discovery and exploration of useful minerals, technology of prospecting and exploitation, establishment of working conditions and safety standards in mining developments during forty years of the Soviet regime. Exploration and development of the mineral resources of the Pechora basin, Kola Peninsula, Northern Ural, Yakut A.S.S.R. and the Lena and Tunguska coal-bearing basins are mentioned among others. The extensive literature lists attached to the papers include works dealing with arctic areas. ***Copy seen:*** DLC.

(*Its:* Trudy, 1958. t. 14, p. 149–54.) Text in Russian. ***Title tr.:*** Resolution of the Permafrost Engineering Section of the 7th Interdepartmental Conference on Permafrostology.

Problems for future study in the fields of foundation construction, mining, road and railroad construction, hydrotechnical development, sanitary facilities, and thermophysical studies are discussed. Rigid foundations are recommended for small installations and non-rigid foundations for those occupying large areas. The need for improved methods for deep thawing of frozen ground for mining purposes, utilization of solar radiation for preparation of frozen ground for excavation, and conservation of freezing temperatures in mines is stressed. It is recommended that pipes of sanitary installations be placed at a min. depth and that thermal insulation with the best hydrophobic properties be used. Methods must be developed to determine the thermal conductivity and hydrological characteristics of frozen ground for practical calculations, taking into account the individual components of the thermal exchange between the ground and the ambient medium, together with water migration and seepage.—From SIPRE. ***Copy seen:*** DLC.

Text in Russian. ***Title tr.:*** Alkaline granites of the Kola Peninsula; a collection of papers.

Alkaline granites, formed by the platformic type of Paleozoic intrusions in Kola Peninsula, occupy an area of about 3,500 km.^{2} They have undergone systematic study by numerous scientists since 1928, of which the results, extensive scientific data on their geology and petrology, appear in these 17 papers. The preface by the chief editor, O. A. Vorob'eva, outlines the arrangement of the collection and the main features of alkaline granites. The collection comprises an introductory article by A. I. Morozov, and two groups of papers, the first describing individual alkaline granite intrusions; the second dealing with the geologic position, tectonics, petrographic characteristics, petrochemistry, metallogeny, and the origin of the alkaline granites. The papers are listed in this Bibliography under the authors' names, viz. (titles tr.):

MOROZOV, A. I. Distribution features of alkaline granites in the range of the Peninsula and the history of their investigation.

IVANOV, A. M. Alkaline granites of Zapadnyye Keyvy.

Khrgian. Moskva, Izd-vo Akademii nauk SSSR, 1957. 106 p. illus. tables. Text in Russian. ***Title tr.:*** International Geophysical Year; Information bulletin, no. 2. A. Kh. Khrgian, editor.

Contains program of scientific investigation during the International Geophysical Year, 1957–1958. (p. 3–46): World days, planned activities of the U.S.S.R. in 14 sections (as adopted by the Special Committee of the IGY at Barcelona Sept. 10–15, 1956) and stations to be occupied by each. Data on stations include coordinates and scope of observations. 275 of the stations are to participate in meteorological observations (42 in the Arctic), 36 (11) in geomagnetic, 39 (22) in auroral and night sky luminescence, 28 (8) in ionospheric observations; 14 are for solar studies; 12 (4 arctic) for cosmic radiation, 19 for longitudinal and latitudinal observations; 12 stations (3 arctic) for glaciology; 10 vessels, (among them the *Vitíaz'* and *Ob'*) and 10 stations (4 arctic) are for oceanographic, and 22 stations (6 arctic) for seismic observa-

511326—60——3

tions. Equipment of the stations, instruments, methods and scope of observations are noted for each section. In glaciology section, for example, "the basic problems of ice and snow investigations and research programs of the U.S.S.R. associated therewith are outlined, and data on the location of stations are tabulated. The program includes studies on snow cover, its physical and mechanical properties, and changes with time and under the action of physiographical factors. The effects of snow cover on heat exchange at and in the ground will also be investigated as well as fossil ice and permafrost, their structure and origin. Soviet glaciologists have recently developed the methodology and instruments needed for the glaciological observations. Results of these preliminary studies will be reported before the International Glaciological Conference in 1957."

Announcement of the Soviet Committee of the IGY (p. 47–50): organization of the European-Asiatic regional center of "world days" in Moscow, headed by N. V. Pushkov, to serve all Communist countries, including China and Yugoslavia, and "possibly" Finland and Iran.

Plan of scientific investigations during the IGY, (p. 51–54) with changes in the Soviet organizations and scientific institutes participating, as pub. in *Informat͡sionnyĭ b͡ulleten'*, no. 1, Aug. 1956.

Arctic Conference (p. 55–60): Account by M. F. Kurykova, of the IGY conference at Stockholm, May 22–25, 1956: the Russian representatives (eight) headed by V. V. Belousov, papers delivered, work of ten special teams set up, some changes in the program planned in the Arctic. Suggestion for Scandinavian countries to organize a transarctic flight for study of cosmic radiation is noted.

The Third Antarctic Conference, July 30–Aug. 4, 1956, is reported by G. A. Avsi͡uk (p. 61–68).

Conference of representatives of the countries of East-European region for preparation of IGY is reported by I͡U. D. Bulanzhe (p. 69–73). It was held in Moscow, Aug. 20–25, 1956. The U.S.S.R., Bulgaria, Hungary, East Germany, Poland, Rumania, Czechoslovakia, Yugoslavia, as well as China and Mongolia participated. Problems relating to 13 sections of geophysical investigations were discussed; work pledged by each country is reported (table p. 73).

Fourth Conference of the Special Committee of the International Geophysical Year, at Barcelona Sept. 1956, is reported by V. V. Belousov (p. 74–86).

Activities of the Interdepartmental Committee for Preparation and Realization of IGY at the Presidium of the Academy of Sciences of the U.S.S.R., are reported by A. D. Povzner (p. 87–94): its organization, work, and membership, which includes several arctic explorers. G. A. Avsi͡uk, E. I. Tolstikov, M. E. Ostrekin.

Preparation of the Hydrometeorological Service of the U.S.S.R. for IGY is reported by L. I. Popov (p. 95–99): 38 observatories and 12 institutes of the Main Administration of Hydrometeorological Service (GUGMS) are to organize observations of 292 hydrometeorological stations according to IGY schedules. The planned work, including that in the Arctic, is indicated.

Fedchenko Glacier in the Pamir-Alay Mts. and its investigation is reviewed by V. F. Suslov (p. 100–105).

Personnel changes in some of the Russian IGY teams are added (p. 106).

ALASKA. DEPT. OF HEALTH, *see Alaska's health.* Ninth . . . report . . . Alaska Department of Health, 1954–1956 . . . *1957.* No. 49219.

49198. ALASKA. EMPLOYMENT SECURITY COMMISSION. Financing Alaska's employment security program. Juneau, Oct. 1958. 3 v., tables, graphs, maps. Refs.

Disbursements to unemployed during 1952–1958 have consistently exceeded funds provided for this purpose under the Alaska Employment Security Act. Data are presented as basis for working out changes in the Act. Anticipated disbursements (benefit costs) and income required for the 1958–65 period are considered on specified economic and legislative assumptions, and alternate recommendations are made. Alaska has special problems due to the high seasonality of industry, and other exceptional factors in its economy. Insured unemployment, averaging 12%, and the resultant benefit cost rates, almost 4%, are approx. three times the national average. Earnings in insured employment average about two-thirds higher than the United States generally. The report is in three parts: Projected costs of unemployment insurance in the 49th state (36 p.) by E. W. Maxwell; Analysis of the Alaska economy and its future outlook by G. W. Rogers (see No. 54371); and a statistical supplement of 54 pages.

Copy seen: CaMAI.

49199. ALASKA. GOVERNOR. Annual report 1957. Washington, D.C., U.S. Govt. Print. Off., 1958. 122 p.

Reviews work of federal and territorial government departments for the fiscal year ending June 30, 1957. Statistics, comparisons with previous years, and future plans are included. The Territorial Government was in sound financial shape; employment had increased slightly over 1956; and oil discoveries, growth of the pulp industry, and increase in timber sales brightened economic prospects. Earlier reports were listed as No. 38475, 43544, etc. ***Copy seen:*** DLC.

49200. ALASKA. RESOURCE DEVELOPMENT BOARD. Alaska passenger traffic survey 1956, 1957. Juneau, July 1957, Aug. 1958. 2 no.: 14, 16 p.

Compilation of annual traffic figures (cf. No. 43541) based on information supplied by steamship lines, scheduled airlines, Alaska Dept. of Police and Canadian Dept. of Citizenship and Immigration (Alaska Highway). Data on airline, highway, and steamship travel are graphed, tabulated and discussed. Airlines carried 59.8% of the total traffic in 1956, 58.2% in 1957; highways 32.7 and 33.8%; and steamships 7.5 and 7.9%. Alaskan transportation reached an all-time high in 1956, and increased in 1957 (7.1%) to 314,698. Continuing a trend started in 1954, departures exceeded arrivals by 6,571 persons in 1956; 8,556 in 1957. ***Copy seen:*** DLC.

49201. ALASKA. RESOURCE DEVELOPMENT BOARD. Biennial report, 1955–57. Juneau, 1957. 74 p. maps, graphs, tables.

Summarizes the Board's activities and its assistance to timber, power, transportation, petroleum, mining, fisheries and land development. The three "growth" industries of timber, tourism and petroleum are emphasized, and the impact of Federal expenditures and employment on the Alaskan economy is discussed. Studies and reports of the Board and its future plans are noted. Brief summaries are included of the biennial reports of the Depts. of Mines, Fisheries, Agriculture, Lands, and Aviation, and the Office of Highway Engineer. For earlier reports of the Board see No. 38473.

Copy seen: DLC.

49202. ALASKA. RESOURCE DEVELOPMENT BOARD. Estimate of Alaska population, July 1, 1955, to June 30, 1956; July 1, 1956, to June 30, 1957. Report no. 5, 6. Juneau, 1957, 1958. 2 v., graphs, tables.

Contains monthly estimates, July 1955–Dec. 1957, of civilian immigration, emigration and excess of births over deaths; annual U.S. Census Bureau population estimates, 1939–1957; and monthly estimates from Jan. 1, 1950 to July 1, 1957, of military, and to Jan. 1, 1958, of civilian population totals. Fiscal year 1956 had an increase of 3,201 civilians and a decrease of 5,000 military: net loss of 1,799 persons. Fiscal year 1957 had an increase of 6,596 civilians and of 2,000 military: total increase of 8,596 people. Earlier reports are listed as No. 38485 and 43542.

49203. ALASKA. RESOURCE DEVELOPMENT BOARD. Financial data regarding the incorporated towns and cities of Alaska, 1956, 1957. Juneau, Aug. 1957, Oct. 1958. 2 v. graphs, tables.

Presents results of fourth and fifth financial surveys of 31 municipalities: total assessed valuation of real and personal property, 1935–1957; assessed valuations and tax rates, 1956–1957; bonded indebtedness; and statistics of Alaska school districts for 1957 (valuation, tax, enrollment, cost per student). Property valuation for 1956 was $287,226,767, an increase of $28,972,297 (11.2%) over 1955; for 1957: $294,041,104, increase of 2.4% over 1956, with rate of increase continuing to decline. Anchorage, Fairbanks, Ketchikan, and Juneau accounted for 76% of total property value both years. Previous reports, No. 38486 and 43543. ***Copy seen:*** CaMAI.

49204. ALASKA. UNIVERSITY. Scientific activities of the University of Alaska. College, Alaska. Dec. 1958. 66 p. table. Prepared by Graduate Council Research Committee.

Summary of scientific activities, except for teaching: projects in agriculture, anthropology, biology, earth sciences, engineering, mathematics, paleontology, physics, philosophy of science, social sciences, wildlife management; collections and publications, facilities and services are noted. Nearly all projects deal with Alaska. ***Copy seen:*** DWB.

49205. ALASKA. UNIVERSITY. EXTENSION SERVICE. Alaska mushrooms. College, Alaska, Aug. 1952. 8 p. illus. Mimeographed. (*Its:* Bulletin no. F–46.)

Descriptions, illus. and use of wild mushrooms, distinguishing edible from poisonous kinds. ***Copy seen:*** DA.

49206. ALASKA. UNIVERSITY. EXTENSION SERVICE. Condensation control for Alaska's farms and homes. College, Alaska, June 1957. 19 p. diagrs., tables. (*Its:* Bulletin no. 800.) Revised by C. I. Branton.

Moisture condensation within the walls of buildings causes deterioration of structural materials and peeling exterior paint. The problem has become more serious as new construction methods result in warmer and more moist air within the buildings. This aggravates

the problem by building up an increased vapor pressure gradient, particularly during cold weather. Methods of control are outlined: they include installation of a vapor barrier near the inner wall, insulation to keep the inner wall and vapor barrier above the dew point temperature, and ventilation to prevent excess moisture accumulation in the air.

Copy seen: CaMAI.

49207. ALASKA. UNIVERSITY. EXTENSION SERVICE. Planning and managing greenhouses in Alaska. College, Alaska, 1958. 23 p., illus., tables. (*Its:* Bulletin 804.)

Criteria of site selection, the light, heat, water and ventilation requirements, and size are considered. Soil, fertilizers and manure, tilling, raising of seedlings, transplanting, pests and diseases, etc., are discussed. Main greenhouse crops for local conditions (tomatoes, cucumbers, beans, corn, melons, etc.) and their raising are described. Plan and materials are given for a greenhouse 14 x 11 x 13 ft. For construction details, see No. 39761. ***Copy seen:*** CaMAI.

49221. ***ALASKA'S HEALTH.*** Southeast Alaska speech and hearing program is extended to additional communities in 1958. (Alaska's health, June 1958. v. 15, p. 5, illus.)

Contains information on the origins of the program; areas of current extension; supporting organizations, activities in various areas, summer program, instruction among teachers, adult therapy.

Copy seen: DLC.

49222. ***ALASKA'S HEALTH.*** Study causes of death of Alaska infants. (Alaska's health, Apr. 1957. v. 14, p. 1–2)

Study based on 1634 death certificates of infants up to one year old. Among whites, mortality was found to be not higher than in the continental U.S., but among the native children it was excessive, respiratory and other infective diseases being the main cause of death after the first week of life. A breakdown of mortality according to age of the infants is also presented.

49223. ***ALASKA'S HEALTH.*** Vaccination against rabies recommended for dogs, also cats, by Health and Agricultural Depts. (Alaska's health, June 1958. v. 15, p. 1, 4, illus.)

Information is presented on occurrence of rabies in Alaskan wild and domestic animals; vaccination for animals and man; rabies in foxes; cases in 1958; veterinary aid, etc. ***Copy seen:*** DLC.

49224. ALBERS, CLAUS, *and others.* Blutgase in Hypothermie; ein Beitrag zur Frage der Hypoxietheorie des Kältetodes. (Pflügers Archiv für die gesamte Physiologie, 1958. Bd. 266, Heft 4, p. 373–93, illus. tables.) 51 refs. Text in German. *Other authors:* W.

Brendel, A. Hardewig, *and* W. Usinger. ***Title tr.:*** Blood gases in hypothermia; contribution to the problem of the theory of hypoxia in death from cold.

A study of dogs made hypothermic to about 20° C. Arterial and venous O_2-saturation, arteriovenous O_2-difference, O_2-tension and capacity were recorded, as well as CO_2-content, tension and elimination. Alkali reserve and pH were also determined. Additional hypoxia had no effect upon lethal temperature or upon circulation. The results indicate that there is no basis for assuming hypoxia to be the cause of death from cold. ***Copy seen:*** DLC.

49225. ALBERS, CLAUS, *and others.* Der intrapulmonale Gasaustausch in tiefer Hypothermie. (Pflügers Archiv für die gesamte Physiologie, Dec. 1957. Bd. 266, Heft 1, p. 48–49.) Text in German. *Other authors:* A. Hardewig, W. Brendel, *and* W. Usinger. ***Title tr.:*** Intrapulmonary gas exchange in deep hypothermia.

Summary of investigation on alveolar-arterial differences in O_2-tension in hypothermic dogs. A short-circuiting of circulation in the lungs with a concomittant exclusion of pulmonary ventilation is offered as most likely explanation of conditions. ***Copy seen:*** DLC.

49226. ALBERS, CLAUS, *and others.* Der intrapulmonale Gasaustausch in tiefer Hypothermie. (Pflügers Archiv für die gesatme Physiologie, 1958. Bd. 266, Heft 4, p. 394–407, illus. tables.) 21 refs. Text in German. *Other authors:* W. Brendel, A. Hardewig, *and* W. Usinger. ***Title tr.:*** Intrapulmonary gas exchange in deep hypothermia.

Account of experiments on dogs made hypothermic to 25° C. with narcosis and artificial respiration applied. Conditions both with hypoxia and hyperoxia were studied with respect to their effect upon alveolar-arterial pressure difference. Blockade of the lower lung was also applied to ascertain this difference. The results suggest formation of a "functional atelectasis" in hypothermia. ***Copy seen:*** DLC.

49227. ALBERTA-NORTHWEST TERRITORIES BOUNDARY COMMISSION. Report of the commissioners appointed to direct the survey and demarcation of the boundary between the Province of Alberta and the Northwest Territories. Ottawa, 1956. 2 v.: 62 p. illus., col. map, tables; and 21 maps in atlas vol.

Reports on methods, procedures and problems of the 310-mi. survey at 60° N. A general description is given (p. 39–49) of the topography, forest cover, minerals, game and fur, derived from surveyor's report on each sector. The atlas volume contains an index map and map sheets, at scale 1:63,360, showing the boundary established. Each sheet covers a sector of 30′ along 60° N. from 110°00′ W. to 120°00′ W. Also included on each sheet are profiles giving elevations of boundary monuments at vertical scale of 1 in.: 400 ft. ***Copy seen:*** DLC.

49228. ALCOCK, FREDERICK JAMES, 1888– . General activities of the National Museum of Canada. (Canada. National Museum. Annual report for the fiscal year 1955–56, *pub.* 1957. Bulletin, no. 147, p. 1–21.) Refs.

Reviews field and office work, 1955–1956, of the Museum, its Depts. of Archeology, Ethnology, Zoology, and the National Herbarium, listing publications and zoological and botanical accessions. Work noted in the North, includes mammals studies especially caribou, small mammals collecting in Newfoundland-Labrador by Austin W. Cameron and W. John Smith; biological survey near Eureka on Ellesmere and on Axel Heiberg Island by S. D. MacDonald; archeological excavations of nine cultural complexes by R. S. MacNeish's party to the Firth River area, in Yukon Territory, possibly providing a link between the Eastern Woodlands culture and that of northeast Asia; excavations of Dorset culture on Southampton Island by H. B. Collins, W. E. Taylor and others during a joint expedition with the Smithsonian Institution; ethnographic studies in the Fort Simpson area by J. H. MacNeish and in the Belcher Islands by G.-R. Lefebvre; and Claude-Dumont Desgoffe; preparation of a glossary of the principal sub-dialects east of Hudson Bay by G.-R. Lefebvre. ***Copy seen:*** DGS.

49229. ALCOCK, FREDERICK JAMES, 1888– . The romance of northern exploration. (Canadian geographical journal, Sept. 1958. v. 57, no. 3, p. 76–83, ports.)

Notes discoveries in northern Canada by Samuel Hearne, Alexander Mackenzie, Philip Turnor and Peter Fidler, David Thompson, Sir John Franklin, John Richardson, George Back, A. R. C. Selwyn, Joseph B. Tyrrell, A. P. Low, and others. Impetus came from desire to find a Northwest Passage, the fur trade, and Geological Survey investigations.

49234. ALEKSANDROV, V. A. Narodnye vosstaniîa v vostochnoi Sibiri vo vtoroĭ polovine XVII v. (Istoricheskie zapiski, 1957. t. 59, p. 255–309.) Approx. 60 refs. Text in Russian. ***Title tr.:*** People's uprisings in eastern Siberia in the second half of the 17th century.

Discusses the causes and effects of the Siberian uprisings starting with the 1630–1640 revolts at Mangazeya, Yakutsk, Narym, et al., and culminating in the mutinies of the 1690's in Nerchinsk and Yakutsk which spread to the garrisons and settlements on the Lena, Angara, Yenisey Rivers. The economic conditions and aspirations to self-administration are outlined. Resentment against the despotic rule of petty officials and feudal oppression by the gentry in collusion with the Russian military personnel, is shown on the part of resettled peasants, runaway serfs, indentured trappers and tribute-paying (îasachnyĭ) natives, including Tungus and Yakuts. Their fight for rights is traced. The class-struggle aspect of these uprisings and their importance for the following centralized power policy are stressed.

49256. ALLEN, N. P. The brittle fracture of iron and steel. (Teknisk ukeblad, May 9, 1957. årg. 104, nr. 19, p. 375–83, illus., diagrs., tables, graphs.) 12 refs.

Brittle and ductile modes of fracture are outlined. Influence of composition and structure upon the temperature at transition from ductile to brittle behavior is discussed and experimental work reviewed: influence of oxygen, carbon, manganese, cooling and ageing procedures are dealt with in turn. Several notched bar test procedures are reviewed. Dr. Robertson's test for studying the conditions of crack propagation (applying a temperature gradient from −50° C. to +20° C. side-to-side on a sample strip welded to a tensile machine and subjected to stress) is appraised.

Copy seen: DLC.

49257. ALLEN, N. P. Recent European work on the mechanical properties of metals at low temperatures. (U.S. National Bureau of Standards. Circular, May 7, 1952. no. 520, p. 1–35, illus., diagrs., graphs, tables.) 29 refs.

Reviews work since 1940. Elasticity and plasticity are dealt with, and the development of brittleness at low temperatures is discussed in relation to brittle fracture in mild steel, the behavior of heat-treated alloy steels and the reliability of austenitic steels to −200° C. The properties at low temperatures of pure alloys of iron made at the British National Physical Laboratory are described; it is shown that some alloying additions exert influences on the rupture strength that are independent of their influence on the resistance to plastic deformation.

49260. ALLGÉN, CARL ALGON JÖNSSON, 1886– . Vergleich zwischen den marinen Nematodenfaunen Norwegens und der Tropen, I–II. (Norske videnskabers selskab, Trondheim. Forhandlinger, 1956. bd. 29, no. 9, 10, p. 36–40, 41–46, 8 tables.) 29 refs. Text in German. ***Title tr.:*** A comparison between the marine nematode fauna of Norway and the Tropics, I–II.

Based in part on material from the North Norwegian coast. Some 40 nematodes or about 10% of the known tropical species (409) occur in Norwegian waters where they form 12.12% of all Norwegian nematodes. These 40 species occur in tropical America (19), Africa (21), South Asia (10) and Australia (19).

49261. ALTER, AMOS J. Appearance of intestinal wastes in surface water supplies at Ketchikan, Alaska. (*In:* Alaskan Science Conference . . . 1954. Proceedings *pub.* 1957. p. 81–84.)

Account of physical and bacteriological examination of Ketchikan water supplies during a period of one year. It was established that these supplies are "seriously contaminated at certain short periods." Application of U.S. Public Health Drinking Water Standards without consideration of special local requirements, is considered erroneous.

Copy seen: CaMAI.

49262. ALTER, AMOS J. A guide to arctic water works thermology. (Consulting engineer, Apr. 1957. v. 9, no. 4, p. 84–88, illus., diagrs.)

Comments on 21 critical points in an arctic water works system, emphasizing importance of heat conservation over hydraulic and structural design features. Water source, treatment plant, storage and distribution are dealt with. Changes in the thermal regime of permafrost areas, as caused by movement of water or by heat loss from structures and water pipes, are noted. Artificial heating of the water, protection of wells and pumping equipment, foundation design and construction techniques, also choice of pipe material are discussed. Construction of a casing head for a well drilled in permafrost and of a domestic takeoff for a recirculating system are illustrated, the latter being the most critical point in the system. This service connection device, called a "pitorifice", is a modification of the fitting used to connect radiators to a single-pipe recirculating type system, and is used in the Fairbanks, Alaska, water system. ***Copy seen:*** DLC.

49263. ALTER, AMOS J. Health and sanitation problems in the Arctic. (Biology Colloquium, 18th, 1957. p. 110–18.) 39 refs.

Contains information on the climate of Alaska, its population (1950), native, white and transient; development of public health institutions; environmental factors, especially low temperature, and their role in health and sanitation. Infectious diseases and their epidemiology are outlined, also oral, nasal and enteric discharges, and venereal diseases. Diet and nutrition, sanitation, water supply, housing, food control, education, etc., are also considered. ***Copy seen:*** DGS.

49264. ALTER, AMOS J. Water supply in Finland. (American Water Works Association. Journal, Nov. 1951. v. 43, no. 11, p. 897–903, illus. maps, tables.) Ref.

Physiography of Finland (60°–70° N. subarctic climate) is outlined briefly and population distribution indicated. Data of 1949 on 60 major community water supplies (including Rovaniemi and Ivalo) are tabulated: population, water source, treatment, etc. The communities supplied from ground water and those supplied from surface water are about equal in number. The ground water, river pollution, and treatment practices are described, with details of a typical plant diagrammed. Cast-iron, steel, wood-stave and asbestos-cement pipes are the most commonly used in distribution systems; minimum cover on distribution lines is 7½ ft. ***Copy seen:*** DLC.

49265. ALTMAN, ROBERT M., *and* **C. N. SMITH.** Investigations of repellents for protection against mosquitoes in Alaska, 1953. (Journal of economic entomology, Feb. 1955. v. 48, no. 1, p. 67–72, 7 tables.) 3 refs.

Contains results of field tests in June and July 1953 against a mixed population of *Aedes communis, A. punctor, A. excrucians, A. fitchii, A. stimulans, Culiseta impatiens,* and *C. alskaensis.* Tests were made with 15 individual repellents and 12 repellent mixtures for application to the skin, and with 44 repellents and six mixtures for the clothing. The most effective repellents and mixtures for each category are reported. ***Copy seen:*** DA.

49266. ALTUKHOV, K. A. Navaga Belogo moriâ. (Akademiâ nauk SSSR. Karel'skiĭ filial, *Petrozavodsk.* Materialy po kompleksnomu izucheniû Belogo moriâ, 1957. vyp. 1, p. 126–39, illus. tables.) 9 refs. Text in Russian. ***Title tr.:*** The navaga of the White Sea.

Contains information on the pre- and post-Revolutionary fisheries of this codlike species (*Eleginus navaga*); biology of the two White Sea races, including reproduction and growth; ecology, food, distribution, etc.; stock, prospect of development of its fishery.

Copy seen: DLC.

49267. ALTUKHOV, K. A. Nerestilishcha i usloviâ neresta sel'di v Kandalakshskom zalive. (Voprosy ikhtiologii, 1957. vyp. 9, p. 68–77, illus., table, map.) 13 refs. Text in Russian. ***Title***

tr.: Spawning grounds and spawning conditions of herring in Kandalaksha Bay.

Based on actual collection of herring spawn and laboratory observations on its development under local conditions. Areas, time and depth of spawning, and plants on which spawn is deposited were thus ascertained. Physical conditions during and following spawning were also studied. ***Copy seen:*** DLC.

49268. AMALITSKIĬ, V. M., *and* **B. A. ZABELIN.** Lesovoznye dorogi so sbornym zhelezobetonnym pokrytiem. (Mekhanizatsiia trudoëmkikh i tiazhelykh rabot, Feb. 1957. god 11, no. 2, p. 29–31, illus., diagr.) Text in Russian. ***Title tr.:*** Logging roads with assembled reinforced concrete surface.

Construction of heavy automobile roads with prefabricated perforated plates (2.5 x 1.0 x 0.16 m.) is described. Frost-resistant concrete of high quality (Portland no. 300 or higher) is used in this construction. One km. of road is surfaced with 800 plates made of 232 m^3 of concrete and 30.6 tons of steel. The topography of the road is hilly with occasional marshes and soft ground. The construction is carried out with heavy road building equipment (bulldozers, excavators, scrapers, rollers, etc.) in four cycles: clearing the forest and covering marshes with logs and tree branches; preparation of ground; construction of bridges and cuts; and final leveling of the road and surfacing it with the concrete plates. ***Copy seen:*** DLC.

49269. AMANTEA, L., *and* **G. MOSTARDA.** Osservazioni sulla termometria dei vari organi nella perfrigerazione lenta e rapida. (Giornale italiano di chirurgia, May 1957. v. 13, no. 5, p. 437–49, illus.) 36 refs. Text in Italian. ***Title tr.:*** Thermometric observations on various organs during slow and rapid cooling.

Account of observations on rats. During slow cooling, uniform temperature curves were exhibited by the organs examined, suggesting a good adaptation of the organism to this type of cooling. Thermographic differences between the brain and the rectosigmoid suggest a poorer response to rapid cooling.

49276. AMERICAN GEOGRAPHICAL SOCIETY. Geographic study of mountain glaciation in the Northern Hemisphere. New York, 1958. 10 pt. in 9 v. maps, tables. (U.S. Army. Quartermaster Research and Engineering Command, Contract DA 19–129–QM–409) Refs. Mimeo. Chapters are paged separately; number of pages in each part is estimated *infra*.

Basic work, comprising information assembled and summarized from published and other sources on the location, distribution, characteristics, behavior, and significance of existing mountain glaciers; on classification and terminology, with discussion of the glaciers region by region; prepared under direction of William O. Field. In 10 parts, viz:

1. *General aspects.* (67 p., table. Refs.)

Glacier ice covers (1957) about 10% of the earth's land surface, an estimated 5,780,748 sq. mi., of which about 15% is in the Northern Hemisphere. The mountain or alpine glaciers, many of them small, are sensitive indicators of climatic changes; in a highly unstable state, they have a significant influence on man's existence. Their distribution, general characteristics and variations are described, with numerous references to arctic glaciers. The science of glaciology "study of the physical properties of glaciers" is only 125 years old; its development is traced, from early studies in the Alps, to recent detailed, analytical work, spurred by the International Geophysical Year. Glaciers are of two types, with distinctive physical properties and climatological causes: icecaps (examples cited in Spitsbergen, Greenland, and Canada), and ice streams (Spitsbergen, Greenland, Sweden, and Alaska). Glaciological terms (11 p.) are listed chiefly from the ADTIC glossary (No. 42957).

2A. *Alaska and adjoining parts of Canada.* (2 v.: 169, 106 p. 15 maps, tables. Refs.)

Summarizes information (through 1956) on distribution, characteristics and behavior of glaciers of the Coast, St. Elias, Chugach, Kenai, Talkeetna and Wrangell Mts., the Alaska Range, Aleutian Range and Kodiak Island, Aleutian Islands, Brooks Range, Kilbuck Mts. (Tikchik section, southwest Alaska), and Seward Peninsula. These regions and their glaciers are treated in turn, the glaciers are also tabulated with name (if unnamed, with geographic coordinates), drainage identification, orientation, length (mi.), area (sq. mi.), elevation of terminus, and map reference. Extensive literature references include maps and aerial photographs.

2B. *Western Canada and arctic Canada.* (108 p., 6 maps incl. 1 fold., 4 tables. Refs.)

Deals with glaciers of the Coast Mts., Cascades, interior ranges, and the Rocky Mts. in the West; in the North: Labrador, Baffin and Bylot Islands, Yukon, Northwest Territories, Queen Elizabeth Islands. Glaciers of the Torngat Mts. of northern Labrador are the southernmost in eastern North America, and the only glaciers on the continent east of the Rocky Mts.; distribution, characteristics (small, receding), and access routes are discussed. Chap. 4, prepared by W. B. O. Field and John H. Mercer (35 p.) outlines the distribution (in seven subdivisions) and characteristics of the numerous glaciers and the three icecaps which have had special study, on Baffin and Bylot Islands. Two large icecaps: Barnes, 70° N., Penny, 67° N., and small Grinnell Icecap, 62°30′ N., are treated in some detail. Area of glaciers on Baffin (most of them retreating) is estimated at 14,100 to 15,930 sq. mi. Literature references include maps and air photos. In Yukon and Northwest Territories glaciers exist in higher parts of the Selwyn and Ogilvie (little studied), and Mackenzie Mts., the Yukon Plateau, and the Kluane Range; each of these is described briefly. In the Queen Elizabeth Islands, the extensive glaciers cover an area estimated at 41,315 to 43,740 sq. mi., mostly on Ellesmere. The surface of the ice reflects the underlying topography; nunataks or ice-free mountains rise above the ice fields on Ellesmere; the Grant, Grinnell, Sverdrup, and Lincoln Land glaciers are

treated in turn. Two ice fields: "Krueger" and "Schei," are noted on Axel Heiberg Island. The extensive ice-covered area in eastern Devon Island is described, also smaller icecaps on other (Coburg, Meighen, Melville, North Kent) islands. Sources (27) are listed, stressing works of Dr. A. Taylor (No. 48347).

3. *United States, Mexico, and northern Andes.* (65 p., 2 text maps, 7 tables. Refs.)

4. *North Atlantic islands.* (100 p. 11 maps incl. 5 fold., tables. Refs.)

Contains brief general description of environment (geology, climate, vegetation), and detailed information on the glaciers of Greenland, Jan Mayen, Iceland, and Spitsbergen, prepared by Camilla McCauley, John H. Mercer, Jane van Summern, and Charles C. Morrison. Greenland (51 p.) is treated primarily for the alpine glaciers fringing the margin of the icecap, reaching sea level; descriptive data are summarized in tables and detailed descriptions are given for glaciers or glacier groups of the north, east, southeast, southwest, and northwest coasts. Characteristics of these glaciers, including their long- and short-term variations, their significance in military operations and in weather conditions, the effects of icebergs, difficulties of approach, and air traffic are discussed; also equipment recommended, and the importance of Greenland's glaciers to the world as a whole. Sources, including maps, are appraised and listed. Jan Mayen glaciers (10 p.) are similarly treated: restricted to Beerenberg, the extinct volcano in the northern part, 18 glaciers, all receding. Importance of Jan Mayen as a weather station, great difficulty of transport, and sources of information, are discussed. Iceland glaciers are described (27 p.). Vestspitsbergen and Nordaustlandet are dealt with (12 p.); 43 glaciers are shown on a map, scale 1:2,000,000; importance of the area to military planning, to scientific research, and the economic worthlessness of the glaciers are noted. Sources discussed include map sheets in progress at Norsk Polarinstitutt.

5. *Europe and Africa.* (70 p., 3, incl. 1 fold. maps, tables.)

Includes Scandinavian glaciers (12 p.) most of them plateau icecaps, though valley glaciers and cirque glaciers occur. Seven areas are treated in turn: Finnmark, Frostisen, Blåmannsisen, Sulitjelma, Abisko, Kebnekaise, and Sarektjåkko; those of Kebnekaise have been most studied. Scandinavian glaciers have been retreating generally since about 1750; some pauses or readvances have been noted; in the 1930's the retreat accelerated, slowed after 1940, and since 1949 some glaciers have begun to readvance. These glaciers are of economic importance as they supply water for hydro-electric power development. Sources of information are listed (literature and maps) and appraised: a general study of the area is lacking, but certain aspects and individual glaciers have been treated in detail.

6. *Western, arctic, and eastern Asia.* (53 p., 5 maps (incl. 3 fold.), tables. Refs.)

Includes glaciers of the Ural Mts., northeast Asia, and the Soviet arctic islands. In the Northern Ural, 16 small cirque or hanging glaciers are known on Mts. Narodnaya, Sablya, etc. Glaciers of the Verkhoyansk, Cherskiy, Koryak, Anadyr Ranges, and on Kamchatka Peninsula, are sketched. The ice-covered area in Siberia is estimated at 200 sq. mi.; all Siberian glaciers are said to be shrinking. Extensive glaciers and icecaps on Franz Josef Land, Novaya Zemlya, and Severnaya Zemlya are outlined, with mention of those on Viktoriya, Ushakov and De Long. Franz Joseph Land, an area of about 6,000 sq. mi., is 90% covered by glaciers, with tongues descending to sea level. Novaya Zemlya is 31%, or 11,000 sq. mi., ice-covered; glacier tongues reach the sea on both coasts. Severnaya Zemlya, an area of 6,400 sq. mi., is 42% ice-covered; icebergs of considerable size have been seen off the coasts. Glaciers on these islands are said to be receding.

7A–B. *Central Asian mountain system.* (134 p. maps, tables. Refs.)

8. *Environment and cartography.* (28 p. 3 tables. Refs.)

Vegetation and glacial geology are discussed by Calvin J. Heusser: the relation between glaciers and nearby vegetation in the zones of accumulation and wastage; the general geology of glaciers in these zones. Condition of the glacier as reflected in the state of the ice front is noted, as is the presence of an outwash zone. Historical aspects of glacial activity are considered, the effects of earthquakes, moraine cover, tidal action, and presence of ice-front lakes and rivers, the accepted effects of temperature and precipitation. Evidence of recent glacier fluctuation is indicated by vegetation

changes, especially by the radiocarbon ages of ice-overriden trees discovered in the outwash of several glaciers. Phenomena of the arctic area are cited in the course of the discussion. In *Cartography in the service of glaciology* (16 p.) Wm. A. Briesemeister discusses standards and reviews development of glacier cartography. Glacier location maps (22) drawn for this study showing major glaciers and ice fields north of the Equator on comparable scales, are described and evaluated. Scale, size, contour interval, colors, details, etc., are tabulated. These maps reproduced in a limited number comprise a portfolio not distributed with the study. Maps of the atlas which accompanies the study (pt. 10 infra) are also listed.

9. *Glaciers and human activities.* (78 p., table. Refs.)

Significant ways in which glacier phenomena affect man are considered by Charles C. Morrison (25 p.): ice avalanches, outbreaks from ice-dammed and moraine-dammed lakes, glacier variations, role of glaciers in hydrologic problems, outwash plains in relation to occupance and other activities. Further, glacier effects are considered with specific reference to Alaska in: transportation, mining, refrigeration, recreation and wildlife. Laws applying to glaciers are noted. *Some aspects of glacier travel with particular reference to military operations* by E. R. La Chapelle (27 p. tables) deals with problems of travel and bivouacking in temperate and subarctic zones. Indoctrination and training, utilization of experienced climbers, effects of marching and altitude, morale are considered. Clothing, footgear, shelter, sleeping bags, climbing ropes, ice axe, crampons, skis, etc. are discussed. The terrain: zones of accumulation and ablation, moraines, crevasses and ice falls are characterized as travel areas. Surface conditions, routes, and trail-marking, transport of supplies (sledges, pack animals, aerial supply), concealment of troop movement are discussed. Appended is tabulation of U.S. Government issue equipment. In a final chapter (25 p.) E. R. La Chapelle deals also with avalanches, their nature, occurrence, efforts to cope with them, rescue operations.

10. *Atlas of mountain glaciers in the Northern Hemisphere.* Prepared by W. B. O. Field and associates. Natick, Mass., June 1958. (6 p., 48 maps incl. 11 fold., table.)

Includes ten maps, at various scales, of Alaskan glaciers, nine of glaciers in the Canadian Arctic; nine maps of Greenland glaciers; one of Spitsbergen; one of Scandinavia and Jan Mayen; and four of arctic U.S.S.R. Large known glaciers are differentiated from small glaciers reported but not reliably mapped; detailed insets are included, sources indicated. Besides the glaciers, maps show airports, settlements, elevations, routes, etc.

Appendix lists contents of the complete study. ***Set seen:*** DGS.

49277. AMERICAN GEOGRAPHICAL SOCIETY. Preliminary reports of the Antarctic and Northern Hemisphere glaciology programs. New York, July 1958. Various pagings, text maps, diagrs., tables. (IGY Glaciological Report Series, no. 1.) Issued by IGY World Data Center A-Glaciology.

Includes seven reports from five arctic projects, each described in this Bibliography under the author's name, viz:

HEUSSER, C. J. Lemon Creek Glacier, Juneau Ice Field Research Project.

FIELD, W. O. Observations of glacier behavior in southern Alaska, 1957.

ARCTIC INSTITUTE OF NORTH AMERICA. Glaciology program for McCall Glacier, Brooks Range, Alaska.

AMMOSOV, M. K., *see* Akademiîa nauk SSSR. ĪAkutskiĭ filial. Za sovetskuû vlast' . . . *1957*. No. 49170.

49281. AMURSKIĬ G. I. Noveĭshie tektonicheskie dvizheniîa v raĭone urochishcha "Shcheki" na r. Podkamennoĭ Tunguske. (Akademiîa nauk SSSR. Izvestiîa, seriîa geograficheskaîa, Sept.–Oct. 1958, no. 5, p. 47–49, plate, text map.) Text in Russian. ***Title tr.:*** Recent tectonic movements in the region of the "Shcheki" sector of the Podkamennaya Tunguska River.

The morphology of this river valley and development of local relief are outlined. Three morphologic structures are distinguished: the northwest belonging to the Siberian platform, and part of the Tungusska syncline, is covered with Ordovician and Silurian rocks; the middle zone extending northwest-southeast is characterized by fractures and monoclinal folds; the southwestern part is the forefront of the Yenisey Ridge. Differences in the tectonic structure and rock composition are significant for the shape of the valley. This is especially evident in the section upstream from Chernyy Ostrov, in the so-called Shcheki sector (approx. 61°45′ N. 91°30′ E.). Here the wide and rectilinear valley suddenly becomes narrow and canyon-like. In this area recent tectonic movements with present active uplift are noted. The Podkamennaya Tunguska has cut deep into its valley; and the occurrence of deep side valleys supports this uplift concept. The morphology of the region is graphically presented (sketch map), and recent dissections of the Podkamennaya Tunguska are shown (plate).

Copy seen: DLC.

49282. ANAND, B. K., *and others.* Effect of hypothermia on the acetylcholine and glutathione content of brain and heart of dogs. (Indian journal of medical research, Jan. 1958. v. 36, no. 1, p. 21–25, tables.) 18 refs. *Other authors:* C. L. Malhotra, B. Singh, P. G. Pundlik, and G. S. Chhina.

In animals made hypothermic to an average of about 24° C., acetylcholine and glutathione decreased in the heart, hypothalamus, and frontal lobe, and increased in content in the temporal lobe. The significance of these observations is discussed and their potential practical value indicated.

Copy seen: DNLM.

49283. ANAN'EV, EVGENIĬ. V taezhnom more. (Sibirskie ogni, Sept. 1958. god 37, no. 9, p. 105–112.) Text in Russian. ***Title tr.:*** In the taiga vastness.

Describes the lumber industry and forest reserves of the taiga region of Omskaya Oblast' (mainly the Khanty-Mansiyskiy national district), the output of Tûmen'les combine taking out timber (approx. 4.5 billion $m.^3$) in the lower Ob' and Irtysh area, etc. Two-thirds of the Tûmen'les production originates in the southern part of the area, though 96% of the region's timber reserves (mainly cedar and pine) are in the north, as yet little exploited. The resulting deforestation of the south, waste of raw material due to paucity of processing plants, etc., are criticized. Planned development of the north is discussed: 20

logging concerns with an output up to six million m.³ timber a year, wood-processing mills at Narykary, Berezovo, Uvat, etc., road and railroad construction, etc. ***Copy seen:*** DLC.

ANCELLIN, JACQUES, *see* International Commission NW. Atlantic Fisheries. Proceedings . . . 1957–58. *1958.* No. 51935.

49284. ANCHORAGE, *ALASKA.* CHAMBER OF COMMERCE. A study of Alaska's 1957 oil discovery; its strategic value for the nation and land use in developing an oil field within a moose range. Anchorage, Alaska, Oct. 1957. 41 p., illus., tables, diagrs., 3 maps, incl. 2 fold.

The importance of development of oil reserves in Alaska, particularly in the Kenai Peninsula, and its possible impact on the Kenai Moose Range are discussed. Alaska's first commercially producing oil well was discovered on July 23, 1957, on the Peninsula about 40 miles southwest of Anchorage. It is estimated to have a 900-barrel-a-day production capability. An assay of crude from this well is included. Evidence is adduced to show that the oil well development would serve to improve the moose range and aid conservation. Proposed land use for the development is sketched. Maps of the area are also included.

Discusses the nature of earthquakes, the shock waves, and their investigation. Longitudinal and transverse, or primary and secondary waves, their seismographic registration, and determination of their point of origin are explained. In addition to the two permanent seismograph stations at Ivigtut and Scoresbysund in Greenland, a temporary station is planned for Nord on the North Greenland coast during the IGY, equipped with instruments for registering distant earthquakes, and a short-period Willmore seismograph capable of registering distant earthquakes, and a short-period Willmore seismograph capable of registering local earthquakes in the polar region. This is the world's northernmost station.

49287. ANDERSEN, HAROLD ERNEST, 1916– . Clearcutting as a silviculture system in Southeastern Alaska. (*In:* Alaskan Science Conference . . . 1954. Proceedings *pub.* 1957. p. 1–4.) 10 refs.

Presents the case for clearcutting in preference to selective cutting as the best method in this area, and the best form of silviculture. Character of the present forest is described: mostly overmature decadent climax, consisting of three-fourths western hemlock, one-fifth Sitka spruce, and the remainder western red cedar, Alaska yellow cedar and mountain hemlock. Effects of clearcutting on the soil, moisture, microclimate, and forest reproduction and growth are reported, based on research being carried on at the Alaska Forest Research Center, at Hollis. Optimum size and shape of clearcut area may be obtained from this study.

Describes Alaska Forest Research Center's study of the effects of logging on four salmon streams. Watersheds of two of the streams are being logged, and the others left uncut as controls. Comparisons are being made of stream flow, tem-

perature, bed and channel change, turbidity and sedimentation. Preliminary results show no appreciable change in stream flow pattern and no significant difference in sediment concentration. The purpose of the study is to ensure maximum use of the region's timber resources without creating conditions harmful to the salmon.

49290. ANDERSON, ROBERT T. Acculturation and indigenous economy as factors in Lapp culture change. (Alaska. University. Anthropological papers, Dec. 1958. v. 7, no. 1, p. 1–22.) 21 refs.

Discusses the key economic and sociocultural factors of modern Lapp civilization: full-scale reindeer breeding and acculturation. Individualistic traits inherent in pre-pastoral Lapp society are traced and the communalistic nature of the original Lapp *sit* is considered over-emphasized. Increasing individualism based on reindeer ownership and Scandinavian influence combined with the innate cooperative spirit of the Lapps has resulted in the present-day reindeer economy operating on a semi-communal basis. Thus the evolution of Lapp society has consisted in a fusing of sociocultural precepts of cooperation and separatism and not in "a substitution of individualism for communalism."

Copy seen: DLC.

49291. ANDERSON, ROBERT T. Dating reindeer pastoralism in Lapland. (Ethnohistory, Fall 1958. v. 5, no. 4, p. 361–91.) 27 refs.

Differentiates between reindeer breeding and full-scale pastoralism, suggesting the 9th century A. D. as the time when reindeer domestication probably began. Originally subordinated to hunting and fishing, full-scale reindeer-herding developed in the 17th or, possibly, 16th century. Contemporary source materials describing the relative importance of reindeer and reindeer produce in Lapp economy are cited, also taxation lists showing the comparative value of reindeer skins.

Popular account of voyage of first atomic submarine, over the North Pole, from the Pacific to the Atlantic, July 22-Aug. 12, 1958. First attempt failed because of shallow water and thick ice; on the second, depths below and ice thickness above were recorded by sonar. Problems of navigating submarines with conventional equipment near the Pole, where a magnetic compass is useless, and a gyrocompass faulty, are magnified by unknown ocean currents, and inability to see the sun. At the Pole, water temperature was 32.4° F., sea depth

13, 410 ft., pressure ridge of ice extended down 25 ft. Color and surface of the Chukchi Sea ice is described (dirty, highly ridged and hummocked) and compared with the white, relatively flat floes seen on the Atlantic side in 1957.

Abstracts a paper presented at the Eighth Alaskan Science Conference in Anchorage, Sept. 10–13, 1957, reporting results of an aeromagnetic survey of area approx. 6,000 sq. mi. (61°45′–63°00′ N. 145°00′–147°22′ W.). A large area of low amplitude magnetic anomalies extends north from the Chugach Mts. to about 62°30′ N., possibly outlining a structural basin of Tertiary age superimposed upon a Jurassic-Cretaceous trough. Magnetic data suggest that lower Jurassic volcanic rocks underlie sedimentary rocks in the southwestern part of the area, and that the Wrangell lavas of Tertiary and Quaternary age are present at shallow depths beneath the basin in the vicinity of Mt. Drum.

49307. ANDREEV, VLADIMIR NIKOLAEVICH, 1889– . Primenenie aėrometodov dlîa geobotanicheskogo kartirovaniîa i inventarizat͡sii kormovykh ploshchadeĭ. (Botanicheskiĭ zhurnal, Nov.–Dec. 1952. t. 37, no. 6, p. 843–47.) Text in Russian. ***Title tr.:*** Application of aerial methods to geobotanical mapping and pasture inventory.

Deals with methods of mapping reindeer pastures in the far North. Three are distinguished, chiefly on the basis of map scale: for small-scale maps (1:200,000) with the pasture unit about 1000–1500 hectares in area, visual observations are made from aircraft. For larger geobotanical maps (1:100,000) observational data are plotted on a previously prepared base map; 70–100 pasture units of 500–800 hectares can be so plotted in an hour. Air photographs are used for maps at scale 1:25,000 to 1:60,000; and on such, two specialist-observers can plot 200–300 pasture units in an hour. The air-visual and air-photo methods supplement each other. Their advantages and limitations, evaluation from aircraft of pasture types and their value, planes used and the organization of such work are discussed. ***Copy seen:*** DLC.

List and brief discussion of antihistaminics effective (and not effective) against ventricular fibrillation in dogs made hypothermic to 27° C. The compounds were applied when this temperature was reached and in some cases prior to cooling. ***Copy seen:*** DNLM.

49320. ANGELAKOS, EVANGELOS T., 1929– . Distribution of terminal temperatures in hypothermic dogs. (Society for Experimental biology and medicine. Proceedings, Jan. 1958. v. 97, no. 1, p. 107–108, illus.) 4 refs.

A statistical analysis of 110 cases of experimental hypothermia in dogs, induced in a standard manner. There was no evidence that animals terminating in any of the three modes of death were derived from different populations. This suggests that the different terminal events in hypothermia are determined by the terminal temperature and not vice versa. ***Copy seen:*** DLC.

49321. ANGELAKOS, EVANGELOS T., 1929– , *and others.* Ouabain on the hypothermic dog heart. (American heart journal, Sept. 1958. v. 56, no. 3, p. 458–62, tables.) 15 refs. *Other authors:* J. C. Torres *and* R. Driscoll.

Ventricular fibrillation was not more frequent in hypothermic dogs digitalized with ouabain, nor did this drug significantly alter the incidence of fibrillation in experimental ventriculotomy under hypothermia. But hypothermia had a protective effect against arrhythmias produced by toxic doses of ouabain.

Copy seen: DNLM.

49322. ANGELAKOS, EVANGELOS T., 1929– , *and others.* Sensitivity of the hypothermic myocardium to calcium. (Circulation research, Mar. 1957. v. 5, no. 2, p. 196–201, illus., tables.) 9 refs. *Other authors:* S. Deutsch *and* L. Williams.

An increasing sensitivity of the heart to Ca was observed in dogs as their temperature was lowered to 25° C. When rendered hypercalcemic prior to cooling they also succumbed to ventricular fibrillation at a relatively high heart temperature (22–27° C.) while hypocalcemia caused asystole at a lower temperature (14–18° C.). Calcium sensitivity was not pH-dependent at low or normal temperature. ***Copy seen:*** DNLM.

49323. ANGELAKOS, EVANGELOS T., 1929– , *and others.* Ventricular excitability and refractoriness in the hypothermic dog. (American journal of physiology, June 1957. v. 189, no. 3, p. 591–95, illus., table.) 12 refs. *Other authors:* E. G. Laforet *and* A. H. Hegnauer.

Records of ventricular excitability in dogs under progressive hypothermia showed a great extension of ventricular refractory periods. Rate of recovery of diastolic excitability and the response latency were also correspondingly prolonged. It is suggested that the increased susceptibility of the hypothermic myocardium to ventricular fibrillation is related to the changed rate of recovery of excitability. ***Copy seen:*** DLC.

49325. ANGENHEISTER, G. Der gegenwärtige Stand der paläomagnetischen Forschung. (Geologische Rundschau, 1957. Bd. 46, Heft 1, p. 87–99, text maps, table.) 15 refs. Text in German. Summary in English, p. 257. ***Title tr.:*** The present position of paleomagnetic research.

Discusses the reason for natural permanent magnetization of rocks and difficulties of interpretation of paleomagnetic measurements. Method is described of attempted reconstruction of magnetic poles in the geological past from present-day measurements; it implies assumptions incapable of direct proof. Apparent positions of magnetic north pole during the Mesozoic and Paleozoic are given in table. Such data may change considerably in the future.—From English summary. ***Copy seen:*** DGS.

49326. ANGERE, JOHANNES. Jukagirisch-deutsches Wörterbuch, zusammengestellt auf Grund der Texte von W. Jochelson. Stockholm, Almqvist & Wiksell, 1957. 271 p. 28 refs. Text in German. ***Title tr.:*** Yukaghir-German dictionary; compiled on the basis of materials of V. Jochelson.

A dictionary based on Yukaghir lexical material collected by V. I. Jochelson (No. 8146 and 29883) and on a list of about 200 words from the now extinct Yukaghir dialects Chuvan and Omok, compiled by F. F. Matiushkin and published as appendix to F. F. Vrangel's *Puteshestvie . . . 1820–1826* (No. 19001). Translations are given in German, or, occasionally, in English. An introductory analysis of Yukaghir morphology and syntax and an index of German words contained in the dictionary are included. ***Copy seen:*** DLC.

49327. ANGERE, JOHANNES. Die uralo-jukagirische Frage; ein Beitrag zum Problem der sprachlichen Urverwandtschaft. Stockholm, Almqvist & Wiksell, 1956. 243 p. 179 refs. Text in German. ***Title tr.:*** The Uralian-Yukaghir question; a contribution to the problem of linguistic affinity. Ph. D. dissertation to Uppsala University.

Comparative morphological, syntactic and lexical study of the Finno-Ugric - Samoyed - Yukaghir languages and their relationship to Indo-European and Paleo-Asiatic (Chukchi and Koryak) languages. Yukaghir is classed, like the Ural-Altaic group, among agglutinative languages, but no definite conclusion is reached as to whether the linguistic affinities are due to a common ancestral language or to an ancient absorbtion of loanwords and alien grammatical structures. Earlier studies are reviewed and the importance of further ethnographic and archeological investigations to support linguistic research is stressed. The paper is favorably reviewed by G. Vasilevich (in *Sovetskaia ėtnografiia*, 1958, no. 1, p. 180–83) who suggests a comparison of Yukaghir with Tungus languages, Evenki in particular. ***Copy seen:*** DLC.

Larin. ***Title tr.:*** Interdepartmental stratigraphic conference to work

out a unified stratigraphic scheme for the Soviet Northeast.

Contains report on a conference at Magadan, May 10–21, 1957, to review results of 25 years' geological work and bring about better coordination of further exploration and mapping; also to bring some uniformity into the stratigraphy of the region from the Lena River to the Chukotsk Peninsula, and from the arctic coast to the Sea of Okhotsk. The institutions (25) represented at the conference are noted; of the 250 delegates, 75 represented Yakut A.S.S.R., the Far East, Kamchatka and Sakhalin; 104 reports were presented and discussed in plenary and sectional sessions. A uniform stratigraphic scheme over the entire Northeast was adopted only for the Lower Carboniferous, Permian and Triassic; and in the central part of Kolyma massif, for the Silurian and Devonian systems. Temporary working schemes were adopted for the other systems as various sections of the region are not yet sufficiently explored.

Translated into English for the Geophysics Research Directorate, Cambridge Research Center, U.S. Air Force, by the American Meteorological Society. ***Title tr.:*** Climatic zoning of the area draining into the arctic seas.

Outlines the basic climatic and hydrological features of Asiatic U.S.S.R. draining into Kara, Laptevykh, East Siberian and Chuckchi Seas. Taking into account the relation of the mean annual amount of precipitation (P) to the algebraic difference of maximal (summer) and minimal (winter) monthly temperature (A_1), the author uses formula: $K=\frac{P}{A_1}$, where K is degree of the oceanic character ("okeanichnost'") of the climate. Computing K for 600 points, the whole area is divided into seven climatic regions: West Siberia, Yenisey, Taymyr-Khatanga, Lena, Yana, Kolyma-Indigirka and Chukotka. Data on water discharge of the main Siberian rivers are given and discussed. Paper is based on observations of meteorological stations in Siberia and Chukotka in 1930–50.

49358. ***ARCTIC CIRCULAR.*** A manuscript diary written on Mr. Warburton Pike's visit to Back River in 1890. (Arctic circular, 1957. *pub.* Feb.–Mar. 1958. v. 10, no. 1, p. 32–50; no. 2, p. 51–69, text map.)

Contains diary of James Mackinlay, a Hudson's Bay Co. factor who made a journey from Gt. Slave Lake to Back River in the Barren Grounds of Keewatin with Warburton Pike in summer 1890. Mackinlay's "Journal of Fish River Exploring Party" May 7–Aug. 23 agrees with Pike's account (No. 13527) but gives more details particularly on wildlife. ***Copy seen:*** CaMAI.

49359. ***ARCTIC CIRCULAR.*** Mineral exploration in southern Baffin Island, 1957. (Arctic circular, 1957. *pub.* Jan. 1958. v. 10, no. 2, p. 29–30.)

Ultra-Shawkey Mines Ltd. staked 500 claims in 1956 in southern Baffin Island areas showing iron mineralization. Preliminary exploration was carried out in 1957. Five main orebodies were outlined in Chorkbak Inlet area east of Cape Dorset, containing a total of some 356 million tons of iron-bearing material. Sulfide zones were also observed.

49360. ***ARCTIC CIRCULAR.*** Monument to Otto Sverdrup. (Arctic circular, 1957. *pub.* Jan. 1958. v. 10, no. 2, p. 27–28.) Also reported in the *Geographical journal,* Dec. 1957, v. 123, pt. 4, p. 558.

Memorial to this Norwegian explorer and discoverer of the northeastern Queen Elizabeth Islands (Sverdrup Islands) was unveiled at Steinkjer, Norway, July 21, 1957. Supt. H. A. Larsen, R.C.M.P., represented the Canadian Govt. Part of his address is given, noting operations by R.C.M.P. in the Sverdrup Islands, recent migration of Eskimos to areas explored by Sverdrup.

Copy seen: CaMAI.

49361. ***ARCTIC CIRCULAR.*** Move of the Ennadai Eskimo to the Henik Lake area. (Arctic circular, 1957. v. 10, no. 1, p. 13–14.)

Reports airlift (six flights in 24 hrs.) of 55 adults and children in May 1957 from Ennadai Lake (60°45′–61°15′N. 101°–102°W.) 125 mi. northeast to Oftedal Lake in the Henik Lake area where game is more plentiful. The Eskimos were supplied with new tents, fish-nets, ammunition, and food for a month. ***Copy seen:*** CaMAI.

49362. *ARCTIC CIRCULAR.* Protection for the blue goose nesting grounds in Baffin Island. (Arctic circular, 1957. v. 10, no. 1, p. 14–16, text map.)

Two sanctuaries were established in 1957 on the southwest coast of Baffin (approx. 65°N. 72°–75°W.) to protect nesting grounds of blue, snow, and Canada geese also American brant. The smaller Bowman Bay Game Sanctuary (500 sq. mi.) provides complete protection for the most important breeding area. It is within the larger Dewey Soper Bird Sanctuary (3,150 sq. mi.) which provides more limited protection: hunting, molestation of birds, eggs and nests is forbidden, but persons may enter the area, prospecting and exploitation of mineral deposits may be authorized; aircraft are restricted.

ARDAB'EVA, ELIZAVETA IVANOVNA, *see* Kafanova, M. Kak sozdavalas' karta. *1957.* No. 52124.

49366. ARDÖ, PAUL. On the feeding habits of the Scandinavian mosquitoes. (Opuscula entomologica, Oct. 1958. bd. 23, häfte 3, p. 171–91, 3 illus., 6 tables.) 68 refs.

Reviews observations of the last ten years, mainly in northern Norway and Sweden (Tromsö, Pajala). The data collected indicate that the female needs nitrogen for development of her eggs and normally takes it from a warm-blooded animal; but not necessarily so, as her source depends upon the actual composition of the fauna and relative abundance of its components. The energy-requiring flight in search of hosts requires carbohydrates, of which the nectar of flowering plants is the main or exclusive source.

Copy seen: DA.

49367. ARDÖ, PAUL. Studies in the marine shore dune eco-system with special reference to the dipterous fauna. Malmö, Nya Litogafen, 1957. 255 p. 82 illus., 11 tables. (Opuscula entomologica, Supplementum 14) 168 refs.

Ecological study covering northern Norway (collections of R. G. Dahl and H. Andersson), western and southern Norway, Denmark and southern Sweden. The phytal component and its role in the dune ecosystem are discussed; vegetation records (of southern regions) are tabulated (table 6). Geophysical and geochemical constituents of biotopes are noted and discussed as: "biotic factors" (different qualities of the bio-mass) and the abiotic group of factors or "abiotic environment" (soil factors, its water, temperature and age; sand, its color and grain size, wind, etc.) Some 700 dipterous species are listed (p. 97–164), with notes including data on Scandinavian distribution, habitat and frequency. About a hundred of the species are native to northern provinces of Norway. The dipterous fauna consists of an eurytope group of species, not studied here, and a stenotope group. Species within the latter are often restricted to a single zone of the ecosys-

tem. Some of the stenotope flies are studied with the aid of experimental ecological methods, and a close relation demonstrated between thermal preference and choice of zone, as also between dry resistance and light preferenda.

49372. ARKHINCHEEV, IL'ÎA STEPANOVICH, *d.* **1938.** Materialy dlîa kharakteristiki sotsial'nykh otnosheniĭ chukchi v sviîzi s sotsialisticheskoĭ rekonstruktsieĭ khozîaĭstva. (Akademiîa nauk SSSR. Institut ėtnografii. Trudy, 1957. nov. ser. t. 35, Sibirskiĭ ėtnograficheskiĭ sbornik, pt. 2, p. 43–98, tables.) 9 refs. Text in Russian. ***Title tr.:*** Materials for the analysis of the social relations of the Chukchis in connection with the socialist reconstruction of their economy.

Discusses the social and economic conditions of the settled (sea-mammal-hunting) and the nomad (reindeer-herding) Chukchis of the Chaunskiy Rayon, northeastern Chukotka, at the start of collectivization in 1933–1934. The close relationship between the two groups and the evolution of the herders from the fishers and hunters is noted. The primitive tools and weapons of the Chukchis prior to the advent of the Russians are listed. The customs, reindeer-herding and sea-mammal (whale, walrus, seal) hunting economies, family and clan ties, division of labor (male and female), practice of hire and adoption, etc., are described and examples taken from several Chukchi households: poor, middle-class and rich. Territorial organization, physical and geographic conditions, partition of herds on basis of pasturage available, advantages of collective farms, attempted settling of nomad herders, housing, etc., are dealt with. Selected statistics on population, households, herds, per capita income, etc., are given. The paper is prefaced (p. 38–43) by a review, mainly favorable, by M. A. Sergeev, who elaborates on

the subject and gives a biographical sketch of the author. ***Copy seen:*** DLC.

49373. ARKHIPOV, S. A. K stratigrafii chetvertichnykh otlozheniĭ Prieniseĭskoĭ chasti Zapadno-Sibirskoĭ nizmennosti; basseĭn srednego techeniĭa r. Eniseĭa. (Akademiĭa nauk SSSR. Doklady, Sept. 1, 1957. t. 116, no. 1, p. 123–25, fold. table.) 12 refs. Text in Russian. ***Title tr.:*** On the stratigraphy of Quaternary deposits in the Middle-Yenisey basin of the West Siberian lowland.

Contains a scheme of the stratigraphic subdivisions of Quaternary deposits of Yenisey basin, including its lower course. Characteristics of the deposits, faunal, floral and archeological remains, geological age and geographic data are tabulated for each horizon. The stratigraphy of the West Siberian lowland is somewhat different from that of the Russian plains: the result of more violent tectonic movements and larger boreal transgressions, under more severe climatic conditions.

Copy seen: DLC.

49374. ARKHIPOV, S. A. *and* **IU. A. LAVRUSHIN.** K voprosu o stoke r. Eniseĭa v period maksimal'nogo i Zyrianskogo oledeneniĭ. (Akademiĭa nauk SSSR. Izvestiĭa, ser. geologicheskaĭa, June 1957, god 22, no. 6, p. 91–101, tables, text maps, cross-section.) 19 refs. Text in Russian. ***Title tr.:*** On the Yenisey River drainage during the maximal and Zyryansk glaciations.

Presents results of paleogeographic field studies and considerations concerning runoff during two periods of glaciation. Historical development of the Yenisey and its tributaries is reviewed and water balance during glaciations is calculated. The Yenisey is shown to have had the same direction in anthropogene time as at present. For the view (of others) that during glaciations the Yenisey flowed through the Pakulikha, Eloguy and Turukhan valleys to the Aral Sea, there is not sufficient evidence. Climatic and tectonic reasons for the continued northward flow of the river are analyzed.

Copy seen: DLC.

49375. ARKHIPOV, S. A., *and* **IU. A. LAVRUSHIN.** Nekotorye osobennosti stroeniĭa bichevnikov basseĭna srednego i nizhnego techeniĭa Eniseĭa. (Moskovskoe obshchestvo ispytateleĭ prirody. Biŭlleten', nov. seriĭa, god 129, t. 63, otdel geologicheskiĭ, Nov.–Dec. 1958. t. 33, vyp. 6, p. 127–36, illus.) 12 refs. Text in Russian. ***Title tr.:*** Some features of "tow-path" structure of the middle and lower Yenisey River basin.

Outlines the occurrence, structure, types and microrelief forms of so-called tow paths (bichevnik) as developed mainly on the right bank of the Yenisey. The term signifies the zone of the river bank between the median and high water levels, a zone where depositional and erosional processes are active. River dynamics, composition of the material, and the river ice are considered most responsible for this natural "tow path" development. According to microrelief forms, three types are distinguished and their appearance, measurements and forms described. Photos, cross-sections and diagrams of various types are included. "Tow paths" in the valleys of Nizhnyaya Tunguska, Sukhaya Tunguska, Fat'yanikha, Komsa and Bakhta, right tributaries of Yenisey, are also mentioned. Previous studies are reviewed.

49376. ARKHITEKTURA SSSR. Zhilishchnoe stroitel'stvo v gorodakh Sibiri; na iv plenume pravleniĭa Soiuza arkhitektorov SSSR v Novosibirske. (Arkhitektura SSSR, 1958, no. 5, p. 21–31, illus.) Text in Russian. ***Title tr.:*** House building in the towns of Siberia; 4th Plenary Meeting of the Board of the Union of Architects of U S S.R. in Novosibirsk.

Construction problems discussed at the conference are reviewed with emphasis on planning of new towns with houses of special construction suitable for severe Siberian climates. Attention was given to orientation of the houses with respect to the predominant wind direction and sunshine, sufficiently large floor space, and provision of essential utilities and comfort. L. G. Nazarova reported on the construction, with 4- or 5-storey houses at Noril'sk in a permafrost region, for a population of over 100,000. Winter in Noril'sk lasts about 264 days with temperatures as low as −51° C. Other reports discussed appreciable differences between recommended housing standards adopted for European U.S.S.R. and those for Siberian conditions. ***Copy seen:*** DLC.

49377. ARKTISK INSTITUT, *København.* Arktisk Instituts årsberetning for 1958. Charlottenlund, 1959. 5 p. Mimeographed. Text in Danish. ***Title tr.:*** The Arctic Institute's annual report for 1958.

Reports gifts received, foreign visitors and guests, participation in meetings and conferences, etc.; its liaison work for the International Glaciological Expedition to Greenland, 1957–60, information service on Greenland matters, lending equipment to arctic expeditions, etc. are noted.
Copy seen: CaMAI.

49378. ARKTISK INSTITUT, *København.* Danish scientific activities in Greenland in 1957. Charlottenlund, 1958. 10 p. Mimeographed.

Summarizes research carried out by the Geological Survey of Greenland, and by Lauge Koch's geological expedition to East Greenland; glaciological investigations in connection with the IGY; work done by the Danish Geodetic Institute and by the Meteorological Institute; experiments with marking of ice floes off the east coast; limnological investigations and marine biological studies sponsored by the Universitetets Arktiske Station; zoogeographical, fisheries, and archeological research. ***Copy seen:*** DGS.

49379. ARKTISK INSTITUT, *København.* Danish Scientific activities in Greenland in 1958. Charlottenlund, 1959. 21 p. Mimeographed.

Outlines mapping activities of the Geological Survey of Greenland in the east and northwest, the Godthåb district, the Ivigtut-Nunarssuit and Julianehåb-Narssarssuaq areas; also geological investigations in the Julianehåb district and soil temperature measurements at Godthåb and Mesters Vig. Geological, biological, and paleontological studies by Lauge Koch's 46-man Expedition to East Greenland are reported; also glaciological investigations in the east (leader: B. Fristrup), a Botanical Expedition to West Greenland (T. W. Böcher in charge), and the Carlsberg Foundation Scoresby Sund Expedition (botanical sub-expedition of Lauge Koch's). A report from the Meteorological Institute, which carried out meteorological, climatological, nautical, and geophysical observations, is included. C. Vibe carried out zoogeographical investigations in the northeast; fishery-biological investigations were continued in the west as well as in the east. Three parties of the National Museum studied ancient Eskimo cultures (Gothåb, Thule, Hall Land) and Norse settlements (Julianehåb); social research was conducted at Disko Bugt. Brief reports from the Arktiske Station, Godhavn, and the Geodetic Institute, are included.

49380. ARMAND, A. D. Nekotorye osobennosti stroeniia moreny na Kol'skom p-ove v sviazi s ikh vleniiami techeniia. (Akademiia nauk SSSR. Karel'skiĭ i Kol'skiĭ filialy. Izvestiia, 1958. no. 3, p. 36–42, cross-sections, graphs.) 8 refs. Text in Russian. ***Title tr.:*** Some features of moraine structure in the Kola Peninsula in connection with flowage phenomena.

Study on the granulation and mechanical composition of morainic material collected in the Lake Imandra and Umb-ozero regions and the upper Ponoy River. The structure of moraines is considered in relation to flowage processes; solifluction and its effects in various morainic forms: eskers, hillocks, kames and drumlins are outlined. Various fractions of grains are distinguished and their occurrence in moraine material summarized and percentages given. Assortment of material is discussed as linked with flowage; the latter is recognized an important component and treated in detail. Postglacial and present solifluction are compared. The role of solifluction in forming of eskers, kames, drumlins is outlined. ***Copy seen:*** DLC.

49381. ARMSTRONG, FRED, *and* **D. J. NUTTING.** Engineer Task Force 87. (Military engineer, Jan.–Feb. 1957. v. 49, no. 327, p. 12–14, illus.) Ref.

Reviews experiences of this military unit in constructing roads, dwellings, launching sites, etc., for the Fort Churchill IGY station. Construction begun in April 1956 is to be completed by July 1957. ***Copy seen:*** DLC.

49382. ARMSTRONG, HARRY G., *and others.* The physiological effects of breathing cold atmospheric air. (Journal of aviation medicine, Aug. 1958. v. 29, no. 8, p. 593–97, table.) 10 refs. *Other authors:* A. C. Burton, *and* G. E. Hall.

Account of experiments with dogs breathing air as cold as −62° C. No irritation or injury to the respiratory tract were noted except frostbite, extending for a few millimeters inside the nostril. The air in the respiratory tract below the cricoid cartilage showed no significant difference in temperature from that of controls inhaling air of room temperature. ***Copy seen:*** DNLM.

49383. ARMSTRONG, J. G. Some practical cold climate feeding problems in Canadian Service operations. (*In:* Nutrition under climatic stress, a symposium sponsored by the U.S. Quartermaster Food and Container Institute. Washington, Dec. 1952, *pub.* 1954. p. 8–12.) 5 refs.

Contains information on the climate of arctic Canada; feeding situations (three) and circumstances of their application; rations; survival feeding; the problem of a high-fat diet in the Arctic; food packaging, processing (dehydration) etc.

Copy seen: DNLM.

49384. ARMSTRONG, J. G. Some recent Canadian army ration trials. (U.S. Quartermaster Food and Container Institute for the Armed Forces, Chicago. Activities report, July 1951 (n.s.) v. 3, p. 79–86, illus.)

A firsthand account of field trials conducted during the past three winters at Fort Churchill, Manitoba. Climate, nature of the area, and indoctrination of newcomers are outlined. The rations (three kinds) and their trials, cooking and cooking equipment, life on the trail, and trail rations are discussed.

Copy seen: DNLM.

49385. ARMSTRONG, TERENCE EDWARD, 1920– . The ice of the central polar basin. (Journal of glaciology, Oct. 1957. v. 3, no. 22, p. 105–110, 6 text charts, section, table.) 12 refs.

Drifting parties in the Arctic Basin, 1879–1955, are noted and some results given of recent, largely Russian, work. In winter, concentration of polar ice is ten-tenths, in summer nine- to ten-tenths. On the outer fringes of Basin, certain sea areas remain ice-covered while the surrounding ice melts, phenomena termed "ice massifs" (ledyanyye massivy) by the Russians (the English term "ice clusters" is proposed). "Clusters" north of the U.S.S.R. are shown (chart) in relation to shipping routes. Influence of Lomonosov ridge on ice movement is discussed, with reference to drifts of ice floe stations North Pole-3, -4, -5. In the Atlantic sector of Basin, ice is carried from Laptev and Kara Seas to the Greenland Current in two–three years. In the Pacific sector, drift is slower and ice remains in "closed circulation" about seven years. Effect of wind on ice drift, Zubov's isobaric drift hypothesis are discussed; also growth, thickness, and structure of ice floes. Shumskiĭ's explanation of stratification of a 3 m. vertical section taken on North Pole-3 in July 1954 is given. U.S., U.S.S.R., and Canadian plans for investigations in the International Geophysical Year are noted.

Copy seen: DGS.

49386. ARMSTRONG, TERENCE EDWARD, 1920– , *and* B. B. ROBERTS. Illustrated ice glossary, part 2. (Polar record, May 1958. v. 9, no. 59, p. 90–96, 15 plates.) In sequence to No. 43742, on sea-ice terminology.

Presents definitions and photo-illus. of 56 land-ice and snow terms, as a basic terminology, except for frozen ground and frost action terms, which are excluded.

Copy seen: DLC.

49387. ARMSTRONG, TERENCE EDWARD, 1920– . Insurance against ice risks at sea. (Polar record, May 1957. v. 8, no. 56, p. 421–28, text map, table.) 3 refs.

Reports additional winter insurance premiums for ships by the Institute of Warranties in London. Rates as established are scaled according to region and time of season on the basis of data on navigational hazards, and the ice-worthiness of a ship. The additional winter insurance rates from 1931–1955 for the Hudson Bay Route are tabulated together with official dates of opening and closing of Hudson Strait; waters barred to shipping all year or at specified periods in winter are mapped. Requirements for the strengthening of ships for navigation in ice are listed. ***Copy seen:*** DLC.

49388. ARMSTRONG, TERENCE EDWARD, 1920– . The recording and reporting of floating ice. (Polar record, Sept. 1958. v. 9, no. 60, p. 184–90.) 23 refs.

Notes immediate and long-term uses of such records, development of various, regional systems and recent efforts toward a common system for world-wide use in recording and reporting the distribution of floating ice. Development is traced of methods used in the Baltic, North Atlantic, north Russian, American arctic, and antarctic waters and in the northern Japan and Okhotsk Seas. New advances in recording and reporting techniques are cited. ***Copy seen:*** DLC.

49389. ARMSTRONG, TERENCE EDWARD, 1920– . The Russians in the Arctic; aspects of Soviet exploration and exploitation of the far North, 1937–57.

London, Methuen, 1958. 182 p. illus., diagr., maps. 23 refs.

Recounts for general readers some outstanding episodes in exploration: the *Sedov* drift of 1937–1940, the air expeditions of 1941 (to Pole of Inaccessibility) and since 1948 (High Latitides), the ice-floe drifting stations of 1937 and since 1950. The development of the Northern Sea Route is reviewed, its weather station network, icebreaker fleet, freight traffic, its role in World War II; its traverse by the German raider *Komet* in summer 1940 is discussed. Native population of the Soviet Arctic is outlined, its acculturation and collectivization described and appraised. Chapters are included on the Siberian mammoth and some recent archeological finds, as contributing to elucidate past conditions and events. Soviet achievements in science (meteorology, permafrost, oceanography, etc.) and in resource development (timber, mining, fisheries, etc.) are assessed. The role of the state is appraised, and Russian interest in the Arctic together with a reservoir of trained specialists is recognized, as factors in such achievement.

49390. ARMSTRONG, TERENCE EDWARD, 1920– . William Scoresby 1790–1857. (Geographical journal, June 1957. v. 123, pt. 2, p. 269–70, port.)

Biographical sketch of this English whaler, ship's captain and Anglican priest who made his first voyage to Greenland at the age of ten. In 1806 he achieved a northing, 81°30′ N. 19° E., for a freely navigating ship. His descriptions of Greenland and Svalbard whaling, work on sea ice, instrumentation, and his Greenland survey of 1822 are noted. He left the sea for the church at age 32, but continued scientific enquiries, produced some 60 papers (not listed).

Trädplantornas rotsystem, 1; anmärkningar rörande planteringsdjupet med exempel på humustäckets betydelse för utvecklingen av den planterade tallplantans rotsystem och plantornas tillväxt. (Svenska skogsvårdsföreningen. Tidskrift, 1956. årg. 54, nr. 1, p. 95–106, illus., graph, diagrs.) 10 refs. Text in Swedish. ***Title tr.:*** The woody plants' root system, 1; observations regarding planting depth with discussion of the humus layer's significance for development of the reset pine seedling's root system and the plant's growth.

Depth of root placement and its effects were studied in transplanting pine seedlings. Best development obtained where the roots had been placed at the contact between the surface humus layer and the underlying mineral soil. On the poor podsol soils of northern Sweden contact with the humus layer is recommended. Poor results with Siberian larch in Norrland may be due to the roots having been placed in pure mineral soil. Planting methods are evaluated.

Text in Russian. ***Title tr.:*** Some problems of automation and mechanization in the Arctic.

Describes land-based and drifting (on ice) instruments in use on the Northern Sea Route for remote-triggered, automatic transmission of meteorological observations and ice-drift data. The drifting instruments, containing high-accuracy anemometers, thermometers, and aneroid barometers, transmit in code on radio frequencies to land-based receivers up to 1500 km. distant; their positions are determined by direction finders at the receiving station. Of 25 radio beacons placed on drift ice in the Arctic Basin in 1957, eleven were equipped for transmitting meteorological observations. Shore-based automatic stations are larger and carry more complicated equipment. One type (illustrated), transmitting four times daily in facsimile, produces synoptic charts (457 x 640 mm.) in 15–44 min. at the facsimile receiving stations, to be installed in all arctic weather bureaus and major ice-breakers. New ice-breaking vessels are being equipped for hydrographic investigations; research is being conducted at the Arctic and Antarctic Institute and the Dept. of the Navy to develop new means, other than ice-breakers, of breaking or weakening sea ice. ***Copy seen:*** DLC.

49404. ASAHINA, ÉIZO, *and* **K. AOKI.** A method by which frost-hardy caterpillars survive freezing at a super-low temperature. (Teion kagaku (Low temperature science), Sapporo, 1958. v. 16, ser. B. p. 55–63, tables.) 19 refs. Text in Japanese. Summary in English.

Slug caterpillars, *Cnidocampa flavescens* of the prepupal stage, first frozen at −20° and then subjected to −90° C. did not survive after thawing, while one-third of non-pre-frozen insects revived. Out of five groups of slugs variously pre-treated and then submerged for a full day in liquid O_2, only that group survived which was kept at −30° prior to and following freezing at extremely low temperature. Some of them developed up to the imago stage, but could not emerge.

Copy seen: DLC.

49405. ASAHINA, ÉIZO. Motility of some animals and an excised tissue in supercooled state. (Teion kagaku, 1957. v. 15, ser. B., p. 45–50, tables.) 5 refs. Text in Japanese. Summary in English.

Excised gills of *Mytilus* or oysters maintained ciliary beating for 15–24 days at −5° C. and for 4–6 days at −10° C. After some 10 days, synchronism of beat is lost at above temperatures. At 0° C. ciliary movement is nearly normal and continues for a month or more. Even after beating ceased at supercooled states, it usually returns to normal following rewarming. Insects were observed to move for ten days or more at −5° to −10° C.

49406. ASAHINA, ÉIZO. On a probable freezing process of molluscan cells enabling them to survive a super-low temperature. (Teion kagaku, Sapporo, 1958. v. 16, ser. B. p. 65–75, illus., tables.) 19 refs. Text in Japanese. Summary in English.

Pieces of oyster gills died if exposed for 30 minutes to −30° C. However, if pretreated with sea water containing 4% glycerol they survived a four-day freezing at −30° C., ciliary movement regaining its vigor even after immersion in O_2. Pre-treatment at −20° had no similar

effect, the lower (−30°) temperature apparently having a dehydrating effect.

Contains a formula for calculating the oil yield of fin whales, using the length and blubber thickness. Curves are drawn which enable the yield to be read off directly. Blubber may be measured on part of the day's catch, and the value estimated for the remainder. Production values in the British factory ship *Balaena* are in good agreement with computed yield (tables). Oil recovered from illegally caught whales should be estimated by this formula, as forfeited oil hitherto has been overestimated.

49413. ASPREY, ROBERT B. The winter war; Finland vs. Russia. (Marine Corps gazette, Aug. 1958. v. 42, no. 8, p. 36–48, illus., maps.)

Analyzes battles of Nov. 29, 1939–Mar. 13, 1940: Russian forces, superior in mass but not equipped for arctic terrain and climate, were warded off and

counterattacked by light, mobile Finnish ski units, which inflicted heavy losses. Describes the Finnish tactic *motti:* areas parallel to the enemy's path (*motti*) were flooded with water prior to cutting and sealing off his forces within them; over paths cut at intervals between the flooded areas, one patrol raced from *motti* to *motti* and attacked with pulka-borne machine guns or light artillery. The enemy, thus isolated, was annihilated by hunger and cold. ***Copy seen:*** DLC.

Geologiîa Sovetskoĭ Arktiki, 1957, p. 424–60.) Text in Russian. ***Title tr.:*** Geological structure of the northern part of Verkhoyansk Range.

Contains a new and comprehensive outline of the relief, stratigraphy, volcanism, tectonics and geological indications of mineral resources. The region (approx. 66°–71° N. 125°–128° E.) consists mainly of the Kharaulakh Mts. and the Orulgan Range. The western slope of the Orulgan and the southern part of the Kharaulakh Mts. are better explored and mapped on a larger scale than the

rest of the region. Stratigraphy of Cambrian, Silurian, Devonian, Carboniferous, Permian, Triassic, Jurassic, Cretaceous, Tertiary and Quaternary deposits is characterized. Magmatic formations, most intrusive, are reported from the Cambrian, Carboniferous, Permian, Triassic and Tertiary periods. The tectonics of the folded region are most influenced by late alpine folding and are well preserved. The main structures are described. For useful mineral resources, the Orulgan Range is most promising with metallic minerals, as yet little explored. ***Copy seen:*** DLC.

(Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Informat͡sionnyĭ bi͡ulleten', 1958. vyp. 7, p. 10–15.) 7 refs. Text in Russian. ***Title tr.:*** Connection between plicated structural forms of the Siberian platform and deep fractures in reference to the Olenek-Anabar regional disjunctive zone.

Reviews the work of V. A. Vakar, P. S. Voronov, and R. M. Demenit͡skai͡a on three meridional and two parallel disjuntive zones of the Siberian platform. Discusses tectonic structure, gravity anomalies, basic and ultrabasic magmatic intrusions of the Olenek-Anabar disjunctive zone. The appearance and development of trap formation and occurrence of diamond-bearing kimberlite pipes are evaluated: further geophysical and magnetic investigations are in order to establish fractional crystallization and prove the existence of useful minerals.

Description of vermiculite deposits found near Maaninkavaara hill in Posio parish approx. 35 mi. southeast of Kemijärvi (66°42′ N. 27°30′ E.) northern Finland. Thirteen deposits were found, two may have economic importance. Technical properties make the vermiculite usable; in addition to large flakes (10 x 10 cm.) small scales of mica were found. ***Copy seen:*** DGS.

49430. AUSTERLITZ, ROBERT. A linguistic approach to the ethnobotany of South-Sahalin. (Pacific Science Congress, 9th, *Bangkok, Thailand,* 1957. Abstracts of papers, p. 48–49.)

A study of 170 plant names known to the Gilyaks, Oroks and Ainu of southern Sakhalin Island. Etymological and ethnological aspects, folk-botanical notions, plant uses (nutritional, industrial, medicinal, ritualistic), plant anatomy and topographic terms were considered and the overlapping of plant uses ascribed to cultural borrowing. Deductions as to the origin of specific plant terminology and its loan pattern confirm previously adduced hypotheses: the Gilyaks and Oroks moved to Sakhalin from the Amur region; the reindeer-breeding Oroks originated in a more temperate area than the Gilyaks whose reindeer terminology is borrowed from the Tungus but not from the Oroks; the heavy borrowing of cultural features from Gilyak implies the Oroks' relatively remote separation from the main Tungus stock. The methodology used for this linguistic analysis and loan word determination is explained. ***Copy seen:*** DLC.

Austenitic steel is found to be superior to other steels for low temperature service, due to its low transition temperature. "In ferritic steels, tempered martensite has the lowest transition temperature, coarse pearlite the highest, and mixed structures containing pearlite and tempered martensite have an intermediate transition temperature. Other significant factors influencing the low temperature behavior are grain size, addition of alloying elements and mode of deoxidation."—From author's abstract.

49434. AUSTIN, TORALF. Skogreisingen må sikres ved årvisst etterarbeid. (Norsk skogbruk, Apr. 1956. årg. 2, nr. 8, p. 247–52, 2 illus.) Text in Norwegian. ***Title tr.:*** Forest raising must be ensured by a yearly cleanup.

Keeping a forest in the best condition

for high growth rate and productivity demands continual care: underbrush, trees no longer needed to shelter young growth, also weeds competing for space, light, and nutrients, should be eliminated each year. Seeding, replanting, fence repair to prevent damage by animals are also required. Regulations for government-supported forests are discussed. Demonstration areas and such educational media as films, lectures, etc., are recommended to publicize this work. Several of its aspects in northern Norway are noted: acreage planted to forest on the north and west coasts has been doubled: demonstration plantings have been established as far north as Troms province.

Summary of local conditions affecting production of tree seed: monthly rainfall and temperature data for the 1955–1957 growing seasons are given, compared with the norm, and effects noted on seed and cone development; beginning dates (1957) of flowering of spruce, fir, birch, mountain birch, Sitka spruce, etc., are given for each province; elevation to which 1957 conditions for seed maturing were good; and elevation below which seed was collected. Both coastal and inland locations in arctic Norway are included. Cones or seed quantities in proportion to numbers of trees with cones are tabulated for spruce, first- and second-year cones on fir, birch, and other trees. Fir trees have had moderately good cone yields each year since World War II but no large yield since 1948. Sale of tree seed increased irregularly from 4,400 kg. in 1950 to 8,400 kg. in 1957. In 1957 the nurseries were rather well supplied, but field seeding was low. ***Copy seen:*** DA.

49436. AVERIN, I͡U. V. Zoogeograficheskiĭ ocherk Kamchatki. (Moskovskoe obshchestvo ispytateleĭ prirody. Otd. biol., n. ser., Bi͡ulleten', Sept.–Oct. 1957. t. 62, no. 5, p. 29–37, text map, table.) 13 refs. Text in Russian. Summary in English. ***Title tr.:*** Zoogeographic survey of Kamchatka.

The ornithological fauna includes four types: Siberian, Tibetan, Chinese and arctic. The first of these, a poorer derivative of the continental taiga of East Siberia, has the greatest number of species. The Kamchatka forests have few species and a number of endemic subspecies, with a very light coloring and large dimensions. The taiga avifauna of the Peninsula is considered Kamchatkan and has some features inherent in insular fauna. Some of the forms are found in the northern and central sections of the Kuril group. The forest area of the Peninsula and a section of the Kurils forms the Kamchatka subprovince.

Text in Russian. ***Title tr.:*** Literary languages of the peoples of the North and local dialects. Based on contributions of Avrorin, Konstantinova, Novikova and Tereshkin to a conference in 1952 (No. 55236).

Discusses problems in creation of a written and literary language for each of the 25 so-called small peoples of the far North. Comparatively few and spread over a vast area, they speak many dialects with many sub-dialects. The experiment of a literary language drawn from all a people's dialects and their variants is criticized as an artificial language, unfamiliar to everyone. The dialect of a large but culturally retarded group may be too poor and morphologically primitive, so that a dialect of an intellectual minority should be used, despite draw-backs: it may be too divergent from other local speeches, or already obsolete due to the culturally advanced group adopting Russian. Former errors in choice of sub-dialect have led to repeated changes of the base-tongue, e.g. of the Voguls, Evenki (Tungus), and Evens (Lamuts). Adoption of the Latin alphabet for the vernaculars, created problems in teaching Russian in the North but these were solved in 1936, by adapting Cyrillic to the phonetic systems of the new literary languages. ***Copy seen:*** DLC.

49452. AVSÎUK, GRIGORIÏ ALEKSANDROVICH. Modern glaciation of the Soviet Arctic. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 15–21.) Ref.

An approach to the study of glaciology is outlined; problems for study in the Arctic and principal features of land glaciation in the Soviet Arctic are described. The main mass of ice, which covers nearly 55,000 sq. km., is found on islands, only about 300–400 sq. km. being located on the continent. Island glaciation includes that of Franz Joseph Land (90% ice-covered), Novaya Zemlya with 23,000 sq. km. of ice, Severnaya Zemlya 16,000 sq. km., and De Long Islands 67 sq. km. On the continent glaciers are found in the Polar Urals in the upper reaches of the Usa and Shchyuch'ya Rivers, near Mts. Narodnaya and Sablya, in the Taymyr Peninsula, in the Kharaulakh Mts., on the upper reaches of the Indigirka, and in the Chukotsk Peninsula. —From SIPRE. ***Copy seen:*** DN–HO.

Abstracts paper presented at the Society meeting in Los Angeles, Apr. 19–20, 1957: more than 400 shocks with magnitudes 6.0 and over occurred to Dec. 1956; a change in mechanism is suggested by the strain-release curve of the sequence; the foci were in or close to the Mohorovičić discontinuity. ***Copy seen:*** DGS.

49461. BÅTH, MARKUS, 1916– . The microseismic importance of cold fronts in Scandinavia. Stockholm, 1951. p. 267–356. diagrs., tables. (Arkiv för geofysik, bd. 1, nr. 12.) 29 refs. Issued also as Uppsala. Universitet. Meteorologiska institutionen. Meddelande, no. 21.

The rate of change of the effective coast length is studied theoretically for a cyclone with circular isobars and for fronts crossing a coast. It is shown that the effective coast length starts to increase when the cyclone is far from the coast, and that, under certain circumstances, the rate of change of the effective coast length may be far greater for fronts than for cyclones. Relations between wind direction and sea-wave propagation are discussed. With observations from Utsira, Kråkenes, Røst, Bjørnøya and Jan Mayen, the difference between sea wave heights for northerly and southerly winds of equal velocities is explained as due to the different turbulent character of the different air masses. A theoretical derivation for a cold front passage of a coast, expressed by microseismic amplitude, period, and time, is presented. Eighteen individual cases 1945–49 are studied by means of weather maps, autographic records, and tidal data, and comparisons are made with the simultaneous microseism. Most favorable situation for large and rapid increase of the amplitudes occurs when a NE-moving intense cyclone is situated in the vicinity of Lofoten (68° N. 14° E.) and cold fronts come down from the northwest. The tides show no immediate influence on the microseisms. ***Copy seen:*** DLC.

Journalist's sketches based on his five-year stay and extensive traveling in Yakutia: the railroad journey from Tayshet on the Transiberian railway to Lena station near the Lena River port Osetrovo, and the trip down the river to Yakutsk (p. 5–21); Yakutsk, its streets, buildings, struggle with permafrost, theater, museums, university, experiments with landscaping (p. 22–36); lumbering in the Nyuya River basin (p. 37–47); the Yakut agriculturist, M. G. Egorov, and his achievements in growing vegetables on the farm at Pavlovskoye in the vicinity of Yakutsk (p. 50–59); the collective farm at Nyurba in the Vilyuy River basin (p. 60–64); the towns of Oymyakon and Ust'-Nera and the model state farm "Balagannakh" (p. 65–75); Sangary coal mines (p. 76–79); the towns of Verkhoyansk, Deputatskiy and their environs (p. 80–90); hunting and trapping in northern Yakutia and the hunting station on the Lyakhovskiye Islands at 74° N. (p. 91–98); a trip to Kyusyur, Tiksi and other settlements on the lower Lena and adjacent coastal areas and to the dairy farm and meteorological station at Tiksi (p. 99–126). The story is recounted of the gold discovery in the Aldan River basin in 1923 and present-day mining there (p. 127–44). The coal and iron ores of southern

Yakutia and discovery in 1952 of coking-coal deposits on the Neryungra River are outlined (p. 145–52). Nyurba, the base of the Amakinskaĭa Diamond Prospecting Expedition, Mirnyy, the center of the diamond industry, and the story of discovery of diamonds in Yakutia are dealt with at length (p. 153–222); achievements are described of A. P. Burov, L. Popugaeva, V. B. Belov, G. Kh. FaĬnshteĬn, V. N. Shchukin, IÛ. I. Khabardin, and others. A map of Yakutia (1:10 million) is included.

49477. BAGARÎATSKIÏ, B. A. Uchet spiral'nykh traektoriĭ protonov pri vychislenii dopplerovskogo kontura vodorodnykh liniĭ v polîarnykh siîaniîakh. (Astronomicheskiĭ zhurnal, Jan.–Feb. 1958. t. 35, vyp. 1, p. 101–111, figs., table.) 19 refs. Text in Russian. Summary in English. ***Title tr.:*** The influence of spiral paths of protons on the Doppler profile of hydrogen lines of auroras.

The depth of penetration into the atmosphere of the stream of corpuscles, having different initial directions, was calculated. The distribution function for the directions of the protons is taken on the assumption of an initial homogeneous bunch dispersed in a non-uniform magnetic field. It is shown that the form of the Doppler profile derived on these suppositions cannot explain the observed form of H_α and $H\beta$. This leads to the conclusion that the scattering of protons in the atmosphere plays an essential role which must lead to a more isotropic distribution of the direction of their velocities.—From author's summary.

Describes synoptic situations tending to cause superrefractive layers over Barter

Island, Barrow, Bethel, McGrath, St. Paul Island and other Alaskan stations. Refractive index curves may be computed from radiosonde data for temperature, humidity and pressure. Superrefractive layers occur less frequently over Alaska than in temperate regions, but may occur with temperature inversions, or strong moisture gradients or stratification. Longer study of temperature, humidity and pressure conditions and their relation to wind velocity, eddy diffusion and large scale weather patterns is needed to deduce refractive index profiles from available synoptic weather reports. ***Copy seen:*** CaMAI.

Materialy, nov. seriâ, vyp. 2, paleontologiâ i stratigrafiâ.) 76 refs. Text in Russian. *Other authors:* R. Kh. Lipman, *and* V. I. Romanova. ***Title tr.:*** Characteristic foraminifera of the Cretaceous and Paleogene of the West-Siberian lowland.

Monographic study dealing with a wide area, notably localities (Berezovo, Khanty-Mansiysk, Pokur, and others) worked during recent years by the writer and colleagues of the All-Union Geological Institute in Leningrad. Description of the fauna is according to the method devised by B. P. Markovskiĭ. The Neocomian period is dealt with by V. I. Romanova, Upper Cretaceous by V. T. Balakhmatova, and Paleogene by R. Kh. Lipman. Forty-two species are described and illustrated, ten (and three varieties) are considered to be new. Comparison is made with foraminifera of other countries. The importance of this work for stratigraphy of the Cretaceous and Paleogene is emphasized.

49496. BALAKSHIN, L. L. Vysokoshirotnaâ okeanograficheskaâ èkspediûsiâ na dizel'-èlektrokhode "Ob'." (Problemy Arktiki, 1958, vyp. 3, p. 124–27, map.) Text in Russian. ***Title tr.:*** High latitude oceanographic expedition on the diesel-electric ship *Ob'*.

Preliminary account, dated Dec. 4, 1956, of the Arctic Institute expedition in 1956 to the northern part of Greenland Sea. The party of 52 scientists headed by the author, left Leningrad on Aug. 4, and was joined en route by a Norwegian and two Swedish scientists; oceanographic observations were begun on Aug. 10; 59 deep-water stations were made in area between Greenland and Spitsbergen, 78–82° N., and bathymetric, hydrologic, hydrobiological and ice data and materials were collected. The favorable ice conditions, contrasting with the heavy ice encountered in 1956 in the eastern arctic seas, are noted. Harmonious collaboration of Soviet and Scandinavian scientists is stressed. The expedition reached Göteborg Sept. 30, on the way home.

49497. BALAKSHIN, L. L. Vysokoshirotnaâ okeanograficheskaâ èkspediûsiâ na ledoreze "F. Litke" 1955 g. (Problemy Arktiki, 1957, vyp. 1, p. 123–35, map.) Text in Russian. ***Title tr.:*** High latitude oceanographic expedition on the ice-breaker *F. Litke* in 1955.

This expedition, sponsored by the Arctic Institute and headed by the author, left Murmansk on Aug. 24, sailed to Dikson Island, then north across the Kara Sea and explored the Arctic Basin north of Franz Joseph Land. The vessel reached 83°21′ N. 53°11′ E. on Sept. 11, the farthest north for a free-sailing ship, refuelled twice at Barentsburg, made two trips in area north from Spitsbergen, and on Oct. 28th returned home. Taking advantage of favorable ice conditions, the expedition studied

the hydrology, chemistry, biology and geology of the little known area of the Arctic Basin, 80–83° N. 15–65° E.; 57 deep water stations were made, 84 bottom samples, including a 412 cm. core, were taken, 27 trawls were made, including 12 in deep water. A depth of 5449 m. was found at 82°23′ N. 19°31′ E., the deepest spot so far known. The great number of polar bears (50–60) on edge of the ice pack is noted. Route of expedition is shown on map (p. 124).

49509. BANFIELD, ALEXANDER WILLIAM FRANCIS, 1918– . The Canadian caribou research programme. (Arctic circular, 1957, *pub.* Jan. 1958. v. 10, no. 2, p. 17–20.) 2 refs.

Caribou is important as food and clothing source in northern Canada. Population estimated at about 670,000 in 1948–49 declined to 277,000 in 1955 in the Mackenzie-Keewatin area. An 18-month research program started Apr. 1957 to determine causes of mortality, and study pathology, range requirements, reproductive cycle, etc. is outlined. Windchill on calving grounds, wolf predation, and drownings are indicated as important mortality causes. Coordinated management practices and auxiliary meat sources for the natives are required. ***Copy seen:*** DLC.

49510. BANFIELD, ALEXANDER WILLIAM FRANCIS, 1918– . The plight of the barren-ground caribou. (Oryx, Apr. 1957. v. 4, no. 1, p. 5–20, 3 plates, 4 text maps.) 4 refs.

Account based on investigation of *Rangifer arcticus arcticus* conducted by the Canadian Wildlife Service from 1948 to 1956, in the region from Hudson Bay to the Mackenzie River delta. Data on the food, behavior, habits, breeding, migration (maps), past and present ranges, the population trend and its causes, are presented. All the evidence in 1948–56 indicates a continued decline in caribou numbers, and man's hunting methods and excessive wastage as the cause. In 1949 168,000 head were estimated killed (100,000 by hunters, 34,000 by wolves, 34,000 by disease and weather); and 145,000 calves born; annual deficit: 23,000 caribou. Not only does man wastefully destroy the caribou itself, but he causes forest fires which ravage its habitat, especially lichens, its chief winter food. The present caribou popu-

lation is large enough to supply basic needs of the dependent human population on a continuing basis, if needed game only are killed and wastage stopped.

49515. BANK, THEODORE PAUL, 1923– . Ethnobotany of northern peoples and the problem of cultural drift. (Pacific Science Congress. 9th, *Bangkok, Thailand,* 1957. Abstracts of papers, p. 46–47.)

Discusses possibility of prehistoric Aleut contacts with Kamchatka and the Kurils, indicated by cultural similarities (aconite poison, whaling, preparation, use, and beliefs in use of plants) among Ainus and Aleuts. Independent invention and historical contact, e.g., from Aleut-Koniag voyages may account for such correspondences; no indication of prehistoric cultural drift via the Aleutians.

Copy seen: DLC.

49516. BANK, THEODORE PAUL, 1923– . Medicinal plant lore of the Aleut. (Pacific Science Congress, 9th, *Bangkok, Thailand,* 1957. Abstracts of papers, p. 44.)

Plants are described (18 medicinal, 3 magic, one poisonous) and their use indicated. Of 150 plants used by the Ainu of northern Japan, half of the genera occur and are similarly used in the Aleutian Islands; but this is not sufficient evidence to suggest a prehistoric cultural contact between these two peoples.

ceedings *pub.* 1957. p. 66–73, map, 7 diagrs.).

Summary of weather observations made on ice island T–3, Apr. 1, 1952–May 14, 1954. Surface and upper air observations showed cold weather throughout the year; summers were cloudy and foggy; winters and springs were relatively clear. Snow fell every month; rain and drizzle occurred frequently in summer. Gale winds were rare at the surface; considerable variation from month to month was noted between the two years.

49518. BANKS, MIKE E. B., 1922– . High Arctic; the story of the British North Greenland Expedition; with 4 chapters by Angus Erskine. London, Dent, 1957. xii, 276 p. 25 photos, incl. ports., 9 maps, and drawings by Lilias Stirling.

Describes preparations, transportation of equipment and personnel, and daily life 1952–54, during the expedition (headed by C. J. Simpson, q.v.) to Dronning Louise Land and the northern part of the icecap. From the landing point on Young Sund, a six-man team traveled with dog sledges to establish the icecap station, Northice, and receive equipment, air-dropped from Thule-based airplanes. Eight weasels, landed at Kap Rink, were driven via Danmarkshavn to the northern base and the icecap. Erskine in charge of the dog transport describes the establishment of Northice, also his sojourn at Jakobshavn in 1951 training the expedition's dogs (with trips to Egedesminde, Jakobshavn Glacier, Qudtligssat, and Umanak). Banks in charge of weasel operations and gravity work describes the journey from Kap Rink via Danmarkshavn to the base at Britannia Sø in Dronning Louise Land, thence to the icecap station, day-to-day life there, work of gravity and seismic teams, and finally their trip across the icecap to Thule. Expedition personnel (30) are listed, 16 participating throughout its two-year period. A chronology, glossary and useful index are appended. ***Copy seen:*** DLC.

Bulletin, Dec. 1958. v. 69, no. 12, pt. 2, p. 1751.) Abstract of a paper presented at the Ninth Alaskan Science Conference, College, Sept. 3–5, 1958.

Describes summer 1957 investigations by the Air Force Cambridge Research Center and Dartmouth College, of Angiussaq Lake about 50 mi. northeast of Thule, which has maintained an ice cover 6–13 ft. thick for ten years. Ice crystals, strength, composition, surface, water depth and temperature were studied, in quest of an explanation of its permanently frozen condition. The crystals were platelike, with horizontal axes and from 0.2 to 100 sq. cm. in size. Glacial ice more than 200 ft. thick was present, also four ice islands over 40 ft. thick. Average water depth was approx. 250 ft. with a 615 ft. maximum. Temperature was approx. 0.2° C. at the surface, increasing to approx. 0.4° C. at the deepest point. ***Copy seen:*** DGS.

49548. BARNES, H. The northern limits of *Balanus balanoides* (L.). (Oikos,

1957. v. 8, no. 1, p. 1–15, text map.) 66 refs. *Pub. also as:* Contrib. no. 897 from Woods Hole Oceanographic Institution.

Contains a study of distribution of this barnacle in polar regions of Europe, Asia and North America and of factors affecting its limits, such as snow and ice cover, ice-foot and severity of conditions. The northern limit of *B. balanoides* and of certain littoral molluscs is determined by conditions in the sub-littoral; this limit closely parallels the summer limits of the pack ice, i.e., its annual maximum retreat. Not the ice-limit as such, but conditions it indicates, determine the limit of these intertidal animals. On the west coast of Greenland, local factors, particularly the high arctic conditions in Melville Bight, are limiting. The biology of the individual species should be considered in attempting to assess the determining factor in their distribution.

49549. BARNES, R. S., *and* **M. Z. FAINMAN.** Synthetic ester lubricants. (Lubrication engineering, Aug. 1957. v. 13, no. 8, p. 454–58, tables, graph.) 20 refs.

Forty-eight esters made from polyhydric alcohols and monobasic acids were synthesized and compared with six dibasic-acid esters; very good properties in lubricity and thermal stability make synthetic esters good lubricants under conditions too severe for mineral oils. Alcohol derived from neopentane has no *beta* hydrogen and gives esters of improved thermal stability. Straight-chain monobasic-acids give good lubricity; such esters improve the lubricity of silicone oils as well as mineral oils. Prepared discussion of the paper and author's comments on the discussion are included (p. 457–58). ***Copy seen:*** DLC.

49551. BARON, H. G. Stress/strain curves of some metals and alloys at low temperatures and high rates of strain. (Iron and Steel Institute. Journal, Apr. 1956. v. 182, pt. 4, p. 354–65, illus.) 32 refs.

Comparative tensile tests were made on a number of metals and alloys at temperatures of +20°, −78°, and −196° C. using strain rates of 10^{-3} and 10^{2} in./in./sec. The experimental methods employed for these static and dynamic tensile tests are described. Microphotographs of the structure of materials tested are included together with a number of stress/strain curves. Strain rate and temperature were found to have a marked effect on iron and the softer ferritic steels. All the ferritic materials exhibited a type of premature failure in dynamic tests below a critical temperature. Lesser effects were noted on the other materials tested. ***Copy seen:*** DLC.

A study of colonic, subcutaneous and cutaneous temperatures in cold-exposed animals both restrained and unrestrained, clipped and non-clipped. Restraint produced hypothermia at low temperatures (0° and 8° C.) and abolished at higher ones subcutaneous to surface temperature-gradient. With severe stress all animals became hypothermic.

Copy seen: DLC.

49563. BARTLETT, ROSCOE GARDNER, 1926– , *and* **P. BERNSTEIN.** Effect of clipping on body temperature of restrained rats exposed to cold. (Society for Experimental Biology and Medicine. Proceedings, Apr. 1957. v. 94, no. 4, p. 639–40, illus.) Ref.

Clipping of restrained rats exposed to cold resulted in less body temperature fall than clipping of non-restrained animals. This is explained by the assumption that the less erected hair of restrained rats caused greater heat loss than the fully erected hair of free animals.

Copy seen: DLC.

49564. BARTLETT, ROSCOE GARDNER, 1926– . Prognostic physiologic changes during immersion hypothermia in the anesthetized rabbit. (Journal of applied physiology, Jan. 1957. v. 10, no. 1, p. 143–45, illus.) 7 refs.

The investigated animals died at temperatures of 4–14° C. An analysis of these results revealed that those which died at higher temperatures (11° to 14° C.) had significantly greater drop of blood pressure, of heart rate and respiratory rate during hypothermia than the group which died at lower temperatures.

49565. BARTLETT, ROSCOE GARDNER, 1926– . Restraint hypothermia and I^{131} uptake by rat thyroid. (Society for Experimental Biology and Medicine. Proceedings, Apr. 1957. v. 94, no. 4, p. 654–56, illus.) 6 refs.

Iodine uptake by restrained animals was higher at one hour and lower at four hours than in non-restrained controls. The lower the temperature was in restrained rats at four hours, the lower was the I^{131} uptake by the thyroid, and restrained hypothermic animals showed a greater I^{131} uptake than free controls. It is concluded that restraint hypothermia is not attributable to lowered basal metabolism. ***Copy seen:*** DLC.

Reports an attempt at mosquito control from aircraft in the construction area of the Bratsk hydroelectric plant on the Angara. The infested area was sprayed from 5–30 m. height at 100 m. intervals with a 2.5–4.5 percent DDT solution or other insecticide, using 100 liters/hectare. Up to 85% of the pests were exterminated and mosquitoes disappeared in the sprayed area for four-five days. ***Copy seen:*** DLC.

49567. BASHARIN, GEORGIĬ PROKOP'EVICH. Iz istorii priobshcheniîa îakutov k russkoĭ zemledel'cheskoĭ kul'ture. [Âkutsk, [Âkutskoe knizhnoe izdvo, 1958. 52 p. tables. Approx. 50 refs. Text in Russian. ***Title tr.:*** History of the Yakuts' integration into the Russian agricultural system.

An analysis, based on contemporary documents, of Yakutia's agricultural development, stressing the important role of the Russian peasants, settlers, political exiles, etc. The peasants introduced agriculture in the upper and middle Lena, Olekma, Amga and Vilyuy River basins during the 17th century and in the Kolyma and Indigirka in the 19th. The gradual spread of farming to the Yakut population and their acceptance of agriculture as a subsidiary economy, particularly in the Yakutsk, Olekminsk and Vilyuysk districts, at the turn of the 18th century are discussed.

The equality of rights enjoyed by Yakut and Russian land-holders is stressed; the problem of unequal taxation (ſasak levied on Yakuts) is minimized and ascribed to the general tyranny of the tsarist and local chieftain's (toyon) administration. Statistical data are given on the 18th-19th century farming population (Russian and Yakut), sown and harvested crops (barley, wheat, rye, garden truck, etc.). A different view of the same question was expressed by the author in 1950 (No. 43898).

Doklady i soobshcheniſa, 1957. vyp. 12, p. 121–27, table.) 13 refs. Text in Russian. ***Title tr.:*** Animal husbandry and land tenure problems of the Tungus of Yakutia in the last third of the 18th to the first third of the 19th century.

Discusses local opposition to Tungus holding land. By the 17th–18th century, cattle and horse breeding had spread from the Yakuts to the hitherto nomadic, reindeer-herding Tungus tribes, mainly in the Vilyuy River area. As the latter thus adopted a settled mode of life, they attempted to acquire pastures and hay fields, but encountered opposition from the long-established Yakuts. Statistical data collected in 1828–30 by the ſasak (fur tax) commissions on population and stock in the Yakutsk, Vilyuy, Verkhoyansk and Kolyma districts (tabulated) showed that 43.3% of all Tungus in Yukatia engaged in stock raising. But their land claims disputed as those of reindeer-herders rather than stockbreeders were recognized only on an *ad hoc* basis. Tungus rights to land in Yakutia remained unprotected by law until 1917.

Translated into English for the Geophysics Research Directorate, Cambridge Research Center, U.S. Air Force, by the American Meteorological Society. ***Title tr.:*** Autonomous stations for long-range observation on currents in the open sea.

In 1956, the Arctic Institute's Kara Sea Expedition used 19 autonomous stations with 30 Alekseev automatic recorders, attached to anchored buoys for current observations. The stations were set at 15 points 25–75 mi. from shore and 15–150 m. depth; the recorders were installed at 12 and 25 m. depth and operated from

two weeks to two months. Technical details of the setting up and recovery of the stations by the ice-breaker *Litke* and schooner *Aktiûbinsk* are described. The experiment was considered satisfactory though two stations were lost, and this method is to have wide use in the future. Chief engineer of the expedition, I. N. Ovsiânnikov was responsible for the technical part of the work.

A typical, comprehensive monthly ice briefing for the eastern American Arctic in April 1956 is presented to illustrate

the observing and forecasting of sea ice conditions as developed by the U.S. Navy since 1949. Steps in preparing the long-range ice outlook are outlined, and the resulting forecast charts are reproduced. Meteorological data and sea-ice conditions are tabulated and mapped. The ice service was developed to facilitate supply operations of the Military Sea Transport Service. The reporting system is based on shore and ship observations combined with air reconnaissance. The observations, forecasts (48 hr., 5 day, 30 day) and outlooks (120–180 days) are appraised. Some of the research projects are discussed. The U.S. Navy Hydrographic Office ship ice log is appended.

49575. BATES, D. E. B., *and* **W. SCHWARZACHER.** The geology of the land between Ekmanfjorden and Dicksonfjorden in central Vestspitsbergen. (Geological magazine, May–June 1958. v. 95, no. 3, p. 219–33, maps, diagrs.) 11 refs.

Results of work on this peninsula (78°40′ N. 15° E.) by a two-man party of the Queens University (Belfast) Expedition to Spitsbergen July 1957. "Devonian sandstones are overlain unconformably by a Permo-Carboniferous sequence of limestones (200 m.) and dolomites and gypsum (300 m.). This is followed by more than 150 meters of Permian cherts. The strata show a slight but consistent dip towards the SSE. A fault having the trend of this dip has been proved in Ekmanfjorden. Sills are intruded in the higher levels of the succession and it is suggested that the intrusions are contemporaneous with the faulting. By comparing the lithology the area can be correlated with the known sections of Billefjorden and Kongsfjorden."—Author's abstract.

Text in Russian. ***Title tr.:*** Alkaline granites of the Kanozero-Kolvitskoye Lake district.

Describes alkaline granites in this 170 km.² area (approx. 67° N. 34° E.) in southwest Kola Peninsula. Geologic structure and cross-section of the country rocks are described. According to petrographic composition, the alkaline granites are distinguished into two groups: those to which belong widespread alkaline gneissose-granites, alkaline gneiss-blastomylonites, aplite-like and aplite granites; and the alaskites and pegmatoid granites. Both groups occur in eight-nine various intrusions which are characterized and shown on map (p. 153). Structural features and mechanics are outlined. Petrographic characteristics of alkaline granites and alaskites are treated and the component minerals, optical constants, texture and other properties outlined. Characteristics of chemical composition are presented, and mode of development characterized. ***Copy seen:*** DLC.

49594. BEAVAN, A. P. The Labrador uranium area. (Geological Association of Canada. Proceedings, Dec. 1958. v. 10, p. 137–45, fold. map.) 13 refs.

Describes the extent, geology, and mineral occurrences of Precambrian rocks

east of Seal Lake, supplementing Evans' account of the geology and copper occurrences (No. 21719). Much of the 2500 sq. mi. belt between Seal Lake and the coast at Makkovik (55°N. 59°10′W.), is underlain by folded sedimentary and volcanic rocks, termed the Croteau Series in the west and the Aillik Series on the coast, but considered to be the same. Pitchblende was discovered in 1954 ten miles south of Makkovik and at numerous sites subsequently. The distribution and variety of radioactive occurrences mark the area as potentially productive; geologically and mineralogically it is similar to the Beaverlodge and Great Bear Lake deposits. It should be termed the Kaipokok (not Labrador) uranium area. ***Copy seen:*** DGS.

49595. BEAVERS, WILLIAM R., *and* **B. G. COVINO.** Antifibrillary effects of glycine in hypothermia. (Federation proceedings, Mar. 1957. v. 16, no. 1, pt. 1, p. 281.)

Summary of experiments with dogs made hypothermic with and without surgical insult. Intravenous administration of glycine eliminated cardiac arrhythmias, reduced the incidence of ventricular fibrillation and increased survival.

Copy seen: DLC.

49596. BEAVERS, WILLIAM R., *and* **B. G. COVINO.** Evaluation of glycine in frostbite prophylaxis. Ladd Air Force Base, Nov. 1957. 13 p. illus., tables. (U.S. Air Force. Arctic Aeromedical Laboratory. Technical report 57-24.) 9 refs.

In an environment of −17.8° C. (0° F.) young, adult males showed increased metabolism two hours after ingestion of glycine. They also showed increased toe, forehead and average body temperatures, and higher forefinger blood flow than their own controls. Thus glycine may be applicable for raising heat production in cold environment.

49597. BEAVERS, WILLIAM R., *and* **B. G. COVINO.** Glycine as an antifibrillary agent in hypothermia. Ladd Air Force Base, March 1958. 9 p. illus., tables. (U.S. Air Force. Arctic Aeromedical Laboratory. Technical report 57-29.) 11 refs.

Dogs were given 5% glycine intravenously and subsequently chilled to terminus, with others submitted to experimental surgical intervention or venous occlusion. Glycine reduced ventricular fibrillation from 96 to 0% in the hypothermic group and from 93 to 29% in that with additional cardiac surgery.

49598. BEAVERS, WILLIAM R., *and* **B. G. COVINO.** Relationship of potassium and calcium to hypothermic ventricular fibrillation. (Federation proceedings, Mar. 1958. v. 17, no. 1, pt. 1, p. 347.)

Dogs cooled to terminus showed 96% ventricular fibrillation, no change in plasma calcium concentration but a fall in plasma potassium. Animals similarly cooled and receiving potassium chloride infusions showed ventricular fibrillation in 57% of cases, and in 50% only when potassium chloride and a chelating agent were used. ***Copy seen:*** DNLM.

49599. BECKEL, DOROTHY K. (BROWN). Studies on seasonal changes in the temperature gradient of the active layer of soil at Fort Churchill, Manitoba. (Arctic, 1957. v. 10, no. 3, p. 151-83,

7 tables, map, 20 graphs, diagr.) 16 refs.

Reports Canadian Defence Research Board's study, 1950–54. Experiments on rates of freeze and thaw of the active layer are described, showing the effects of surface cover, snow cover and characteristics determining the ability of the soil to conduct and absorb heat. Soil temperatures at varying depths were obtained at stations in swamp and high, dry areas of forested and non-forested localities by means of copper-constantan thermocouples and a portable potentiometer. Snow depth, water level measurements and snow temperatures were recorded for part of the time. Correlations between ambient air temperatures and soil temperatures at varying depths and with varying moisture content, ground and snow covers are presented in graphic and tabular form and discussed; also changes in snow temperature at different depths. Findings show a lag, increasing with depth and longest in relatively dry areas, of soil temperature behind ambient air temperatures; and variations in the effect of snow cover according to its hardness, moisture content and depth. The thermal gradient of the snow is affected by changes in temperature of the ambient air and of the soil, ice or water below it.

49600. BECKEL, W. E. Investigations of permeability, diapause, and hatching in the eggs of the mosquito *Aedes hexodontus* Dyar. (Canadian journal of zoology, Aug. 1958. v. 36, no. 4, p. 541–54, illus., table.) 29 refs.

Contains description of methods of obtaining and separating eggs from this common North Canadian species. A study of its development showed two changes in permeability during the prediapause, which are described and analyzed. Diapause was obligate and not broken by moisture or alternate periods of light and darkness. Low temperature (1° and −3° C.) terminated the diapause but the number of eggs hatched did not increase with the time of exposure to cold. ***Copy seen:*** DLC.

(Pflügers Archiv für die gesamte Physiologie, 1958. Bd. 266, Heft 4, p. 408–421, illus.) 16 refs. Text in German. ***Title tr.:*** Regulation of heat production in artificial hypothermia, 1; experimental investigations on the effect of depth of narcosis.

Accounts of experiments with intravasally cooled dogs (rectal temperature 25° C.) under various degrees of Pernocton-narcosis. Nervous regulation is still superimposed during deep narcosis and minimal metabolism above some 31° C.; below that temperature, however, regulation concerns mainly maintenance of respiration. In shallow narcosis O_2-consumption shows an increasing trend with a maximum dependent on degree of narcosis. ***Copy seen:*** DLC.

49610. BEHMANN, F. W. Die Regelung der Wärmebildung bei künstlicher Hypothermie, 2; theoretische Untersuchungen. (Pflügers Archiv für die gesamte Physiologie, 1958. Bd. 266, Heft 4, p. 422–46, illus.) 27 refs. Text in German. ***Title tr.:*** Regulation of heat production in artificial hypothermia, 2; theoretical investigations.

Author develops a mathematical theory of temperature regulation in hypothermia. It demonstrates how the amount of heat production can be regulated through central and peripheral temperature stimuli and how this regulation is quantitatively affected by the Arrhenius relation and by narcosis. Two diagrams make it possible to determine (on the basis of some experimental data) the sensitivity of the thermoregulatory centers as well as the heat producing capacity of the organism.

49613. BÉLAND, R., *and* **P. É. AUGER.** Structural features of the northern part of the Labrador Trough. (Royal Society of Canada. Transactions, June 1958. ser. 3, v. 52, sect. 4, p. 5–15, fold. map., cross-sections.) 24 refs.

Describes area, approx. 58°–61° N. 69°–71° W., from Lake Gérido to Roberts Lake and the basin around Lake Armand to the northwest, the northernmost in a series of sinks and saddles exposed for almost 100 mi., which terminates the Trough in the north. A half graben, it is structurally asymmetrical, with all folds having the same northwest-southeast trend. Lithologically the main part is asymmetrical but the Payne Bay-Roberts Lake segment is symmetrical, with the same sedimentary formations outcropping on both sides. This facilitates locating the eastern boundary of the Trough in this area; elsewhere it is a major problem. On the evidence of partly granitized, highly metamorphosed metasediments older than the Proterozoic Trough rocks, the suggestion is made that some of the other high-rank pararocks recognized along the eastern boundary may not be coeval with the Proterozoic Trough rocks and that the boundary should be sought stratigraphically above them. At Hopes Advance Bay, the structure distribution and composition of the iron-bearing sediments seem to confirm the known theories on deposition of iron-formation in lagoonal basins.

Text in Russian. ***Title tr.:*** Russians in the far North; an historical and geographic sketch of Magadan Province.

Russian expansion into northeasternmost Asia is outlined by one of the present-day native (Kamchadal) intelligentsia. The general geography, climate and economy of the area is described. Magadan Province, created on Dec. 3, 1953, has an area of 1,100,000 sq. km. and extends from Magadan to Vrangel Island in the north and Cape Dezhneva on the east. Russian conquest and exploration from the Cossacks in the 16th century, and peoples native to the region: Tungus, Yukaghirs, Yakuts, Chukchis, Koryaks, Kamchadals, Eskimos, are sketched (p. 14–44). Conditions during the tsarist period and the educational, economic and industrial development, progress of acculturation and collectivization, etc., in Soviet time are described. Dal'stroĭ (Main Administration for Construction in the far North, Glavnoe Upravlenie Stroitel'stva Dal'nego Severa), set up in 1931 as State Trust for Roads and Industrial Construction in the upper Kolyma area, and its activities (p. 57–59), and rise of the town of Magadan (p. 67) are noted. Fold. maps show: (1) routes of Dezhnev, Erastov and Moskvitin expeditions; (2) the boundaries and principal towns of Magadan Province.

Brief survey of activities of the Omsk Veterinary Institute, founded in Oct. 1918. Some 3,700 veterinarians have been graduated by the Institute, which today has 24 departments, with 107 professors and scientists teaching 1,156 students. Reindeer-breeding and disease research by staff members is mentioned.

49630. BELL, CORYDON. The wonder of snow. New York, Hill and Wang, 1957. 269 p. illus., map, photos.

Contains popular account of snow and related phenomena interspersed with historical anecdotes. Brief remarks are made concerning the effects of snow on early peoples. The development of the sleigh and ski for transportation and sport is discussed. The hydrological value of snow and the development and use of snow surveys are presented. Avalanches and glaciers and polar ice sheets are dealt with, as well as the Arctic and its early exploration. A chapter primarily on meteorology is included which demonstrates the causes of snowstorms. Scientists who have attempted to study snow and snow crystals are noted. The final two chapters deal with properties of snow crystals and with their natural and artificial production.

49633. BELMONT, ARTHUR DAVID, 1920– . Apparent diurnal variations of arctic stratospheric temperatures. (American Geophysical Union. Transactions, Aug. 1957. v. 38, no. 4, p. 462–68, diagr., tables.) 18 refs. Extracted from No. 33518.

The diurnal variations of radiosonde temperature data for Narsarssuak, West Greenland (61°11′ N. 45°25′ W.) during 1946–1948 are inspected and compared with data for Thule, Alert, Eureka, and Resolute. Observations were taken at Narsarssuak at local noon and midnight. In winter and spring, the stratospheric temperatures there show a tendency for the difference, noon minus midnight, to diminish or even become negative. Similar patterns for apparent night warming in the lower stratosphere are found also at other stations. Adiabatic semi-diurnal vertical motions required to produce the observed night warming amount to one or two cm./sec. Atmospheric tides may be a contributing cause.—From author's abstract.

49634. BELMONT, ARTHUR DAVID, 1920– . A brief review of research in arctic meteorology. (*In:* Polar Atmosphere Symposium, *Oslo,* 1956. v. 1, *pub.* 1958, p. 30–36.)

Reviews work since the first International Polar Year of 1882–83, principally that since World War II in North America. Need for better information on the general circulation in polar regions and the deficiencies with respect to publication of data are stressed. Two problems are cited for study with arctic data made accessible: the polar trajectory of anticyclones, and the polar stratospheric temperature field.

49635. BELMONT, ARTHUR DAVID, 1920– . Lower tropospheric inversions at ice island T–3. (*In:* Polar Atmosphere Symposium, *Oslo,* 1956. v. 1, *pub.* 1958, p. 215–84, map, graphs, tables.) 45 refs.

About 11 radiosonde observations from this drifting station in the Arctic Basin, June 21, 1952–Apr. 26, 1954, were analyzed with respect to thermal inversions. An objective classification of the inversions was developed with respect to type, magnitude of component layer, and frequency of occurrence. The characteristics and features of the most important types are described. A new unit of inversion "intensity" is introduced which is a combined measure of lapse rate and duration of lapse rate. Some new relationships of inversion characteristics are presented, and a general qualitative theory is suggested to explain the differences found with previous theory. Summaries of the data are tabulated, and suggestions for future work with the data are listed. ***Copy seen:*** DLC.

49636. BELOPOL'SKIĬ, LEV OSIPOVICH. Ėkologiîa morskikh kolonial'nykh ptiţ Barenţsova moriîa. Moskva, Izd-vo Akademii nauk SSSR, 1957. 460 p. illus., tables, maps. About 300 refs. Text in Russian. ***Title tr.:*** Ecology of marine colony-forming birds of the Barents Sea.

A comprehensive study based on author's activities in the area since 1926 and on other sources. In the main, the relations of these birds (the gulls, auks, skuas, terns, etc.) to their environment, to other and to their own species, are considered. Consecutive sections deal with earlier studies and present material and methods; the Barents Sea and the distribution of these birds over it; their food: its nature, acquisition and composition, changes in food habits with age, season, sex, requirements in amount of food, food connections; propagation: migration, nest building, egg-laying, periods, number, care of eggs and young; development and growth; breaking up of nests and colonies; dispersal of birds. Intra- and interspecific relations, competition, enemies, etc., are covered

briefly (p. 365–403). General conclusions, some theoretical problems and practical aspects are included in the final chapter (p. 404–435). Indexes are appended of the birds and Russian and foreign individuals cited in the text.

Summary in English. ***Title tr.:*** Some adaptive features of propagation of marine colony-forming birds in the Arctic.

Discusses two modes of egg development in the Arctic: one, also common in lower latitudes, consists in isolating the eggs from the cold ground by a layer of down, thus ensuring a high temperature in the nest necessary for egg development; in the other mode which represents an arctic adaptation, the embryo develops both at high temperature (in the upper part of the egg, close to the mother's body) and at low temperature when at the bottom of the egg. Other adaptations to the Arctic, including the precocious development of the young, are also discussed. ***Copy seen:*** DLC.

(Annales de géophysique, Oct.–Dec. 1957. t. 13, fasc. 4, p. 253–85, plates, maps, table, graphs.) 12 refs. Summary in French. Contrib. no. 270,

Lamont Geological Observatory. *Other authors:* P. W. Pomeroy *and* H. J. Dorman.

Describes results of a detailed refraction profile made along a ten-mile, north-south line about half way between the western edge and the center of the icecap July–Aug. 1955. Velocity variations in the snow and ice were determined; a layer approx. 100 m. thick, probably not composed of liquid, lies between the ice and the reflecting layer. Dispersive surface waves were recorded and a dispersion curve constructed. Similar reflection profiles (p. 276–85) were shot at three other sites on the icecap, all near Thule. Ice thickness varied from 41 to 191 m. at Red Rock, 280–400 m. at Blue Ice, and from 124–409 m. at Blue Ice-Thule Take Off (TUTO). Subglacial topography was gently undulating at Red Rock but showed large relief at Blue Ice. Selected records are shown (plates) and location of profiles appears on maps; wave velocities are graphed. Work was sponsored by U.S. Air Force Cambridge Research Center and U.S. Army, Corps of Engineers, Snow, Ice and Permafrost Research Establishment. ***Copy seen:*** DLC.

49663. BÉRARD, JEAN. Preliminary report on Bones Lake area, New Quebec. Quebec, 1957. 7 p., fold. map, table. (Quebec. Dept of Mines. Geological Surveys Branch. Preliminary report, no. 342.)

Presents map (1 in.:1 mi.) of an approx. 160 sq. mi. area (58°00′–15′ N. 70°00′–15′W.) about 65 mi. west of Fort Chimo, outlines the stratigraphic, structural and glacial geology. Proterozoic sedimentary rocks, resting unconformably on Archean granitic gneisses, include, from bottom to top: quartzites, iron formations, clastic rocks, and dolomite with layers of quartzite and argillite. In the east, volcanic rocks are intruded by gabbro sills. Two prominent valleys divide the area. Shear zones are present in the lavas, and there is a system of joints of unusually strong development and regularity. Observations of pyrite, chalcopyrite and pyrrhotite, and iron formations west of Bones Lake are noted.

Copy seen: DGS.

49664. BÉRARD, JEAN. Preliminary report on Finger Lake area, New Quebec. Quebec, 1958. 6 p., fold. map (Quebec. Dept. of Mines. Geological Surveys Branch. Preliminary report, no. 360.) 2 refs.

Presents map (1 in.:1 mi.) and outlines geology of an approx. 156 sq. mi. area (58°15′–30′ N., 70°00′–15′ W.) about 70 mi. northwest of Fort Chimo on the geological contact between Archean and Proterozoic rocks. The latter generally rest unconformably upon the former, but in some places are thrust over it. Rock types include Archean granitic gneiss, quartzite, iron formation, clastic sedimentary rocks, dolomite, argillite, lavas, and in the eastern part, volcanic rocks containing gabbro sills. The area is faulted, with various joint systems recorded in different formations. Quartz and calcite veins in the northeastern section contain lead, zinc, silver, gold and copper of possible economic value. Zones of pyrite, pyrrhotite and chalcopyrite, massive pyrite veins and several iron formations, some containing between 30 to 40% iron in the form of hematite-magnetite-siderite are noted. The iron formations have been studied in detail by Consolidated Fenimore Iron Mines, Ltd. ***Copy seen:*** DGS.

49665. BERDICHEVSKAĬA, M. E. O nekotorykh novoobrazovaniĭakh v nizakh mezozoĭskogo kompleksa ŭgo-zapadnoĭ chasti Vilŭŭĭskoĭ vpadiny. (Akademiĭa nauk SSSR. Geologicheskiĭ institut. Trudy, 1956. vyp. 5, p. 201–206, table, plates.) 9 refs. Text in Russian. ***Title tr.:*** Some new formations in the lower strata of the Mesozoic complex in the southwestern part of the Vilyuy depression.

On the middle Vilyuy and its tributaries the Malaya Botuobuya, Vilyuchan and Ygyatta, in recent years, light-colored, fine- and medium-grain sands and porous sandstones have been found which differ in mineralic composition from the overlying conglomerates and sandstones. This entire stratum was unseparated and was considered of Lower Jurassic age. Now the author divides the stratum into two horizons and outlines their lithologic and mineralic composition and conditions for development of various minerals. Special attention is given to zeolites' development, its causes and processes; crystals and chemical composition are described. Thermal metamorphic processes are discussed. ***Copy seen:*** DLC.

(Sovetskaĭa ėtnografiĭa, 1957, no. 2, p. 15–39, illus., maps incl. fold., graph.) Approx. 90 refs. Text in Russian. ***Title tr.:*** Discoveries of pre-Eskimo sites on Alaska and adjacent regions, 1945–1954 field work; the problem of the settlement of America.

Reviews theories on the prehistoric settlement of America based on radiocarbon dating of the archeological finds and discusses recent excavations (shown on maps) made in Alaska, northern

Canada, Greenland and northern Siberia. The similarity of the stone artifacts, pointing to a closely related cultural complex spread over the entire Eskimo area, is stressed; and the settling of America linked with the appearance of the Eskimos. The author favors the theory of periodic invasions by Siberian hunter groups migrating along the coasts of the North Pacific and Arctic Oceans and using both the Bering Strait and Aleutian chain routes. The close linguistic affinities between Aleut and proto-Eskimo make the Aleutian route appear the older of the two, the Eskimos moving slowly north and spreading west across Bering Strait to Asia again, also east to Canada and Greenland. The continuance of mesolithic and neolithic characteristics in Alaskan sites may be due to the conservatism of the Eskimos preserving their stone-age culture almost till the present, and to the cul-de-sac position of the Arctic lying on the periphery of higher developed regions of the Old and New Worlds.

49676. BERGERON, ROBERT. Important low grade iron deposits in the province of Quebec. (Canadian mining journal, Apr. 1957. v. 78, no. 4, p. 105–108, map.) 17 refs. Paper presented at the 25th annual convention of the (Canadian) Prospectors and Developers Association, Toronto, 1957.

Contains description of the rocks and ore zones of low grade iron deposits in the Lake Mistassini (51° N. 73°30′ W.), Mount Wright (approx. 52°45′ N. 67°21′ W.)—Mount Reed (approx. 52°04′ N. 68°08′ W.), and the Ungava Bay (approx. 60° N. 67°30′ W.) areas. The principal formations, rock types, rocks of economic interest, companies searching, and problems of transportation, production, etc. are outlined. Other low grade iron ore deposits in Quebec are mentioned, one of them near Duncan Lake southeast of Fort George on James Bay. Most of the deposits described are shown on map. Large tonnages of such ores are necessary for profitable exploitation, since most of the metallurgical problems of beneficiation have been solved.

Copy seen: DGS.

49677. BERGERON, ROBERT. Preliminary report on Brochant-De Bonnard area, New Quebec. Quebec, 1957. 6 p. fold. map. (Quebec. Dept. of Mines. Geological Surveys Branch. Preliminary report, no. 348.)

Presents map (1 in.: 1 mi.) of an approx. 400 sq. mi. area bounded on the north by Payne River (60° N.) and the east by Ungava Bay, and outlines the geology. The rock formations consist of Precambrian gneisses, divided into western and eastern complexes differing in characteristics; and four Upper Precambrian formations of the Labrador Trough, including an iron formation equivalent to the Sokoman of the Schefferville area. All of the formations, including the gneisses, have been folded and metamorphosed. A north-south-striking thrust fault divides the area almost equally. Premium Iron Ore Ltd. holdings, also holdings and working of low grade deposits by Oceanic Iron Ore (Quebec) Ltd. are noted.

Copy seen: DGS.

49678. BERGERON, ROBERT. Preliminary report on Cape Smith-Wakeham Bay belt, New Quebec. Quebec, 1957. 8 p. 2 fold. maps, table. (Quebec. Dept. of Mines. Geological Surveys Branch. Preliminary report no. 355.)

Deposits containing nickel, copper, lead and zinc have been discovered in this area (approx. 61°–61°30′ N. 72°–78°

W.); 32 companies granted exploration licenses in 1957, and a reconnaissance of the belt and region to the north was carried out by the Quebec Dept. of Mines, including mapping and prospecting in summer 1957. Location, topography and climate are described. Rocks are late Precambrian sedimentary, volcanic and intrusive formations. Glacial sand, gravel and erratics cover much of the surface. A preliminary geologic map (1 in.: 16 mi.) of the Cape Smith-Wakeham Bay belt, and a more detailed map (1 in.: 4 mi.) of the Bilson Lake (61°30′ N. 77° W.) area, are folded into the report. Preliminary examination of the mineralized rocks showed chief nickel mineral to be pentlandite; chief copper mineral appears to be chalcopyrite. Most ore zones graded 1–3% (but some up to 7%) nickel and about 2% copper; zones rich in sphalerite and galena occur west of Nuvilik Lake (approx. 61°30′ N. 74°50′ W.). ***Copy seen:*** DGS.

49679. BERGERON, ROBERT. Ungava Bay—Ungava Peninsula. (Canadian geographical journal, July 1958. v. 57, no. 1, p. 20–29, illus., maps.)

Reviews area south and west of Ungava Bay, northern Quebec, especially its mineral resources. Copper is noted at Gérido Lake, nickel and copper in the Cape Smith-Wakeham Bay belt. Large low-grade iron deposits west of Hopes Advance Bay and south of Payne River are being considered for development by Ungava Iron Ore Ltd. and Ocean Iron Ore Ltd. Mineral exploration is summarized; but only about 5% of the area has been covered adequately; other important finds are anticipated

Discusses and compares Aleut and Eskimo cognates and considers the possibility of Indian influence on Aleut phonology and lexic content. The close relationship of Aleut and Eskimo is noted and their common origin traced to Eskimo-Uralic rather than Eskimo-Indo-european. ***Copy seen:*** DSI.

49683. BERGSLAND, KNUT, 1914– . Is lexico-statistic dating valid? (International Congress of Americanists, 32nd. *Copenhagen,* 1956. Proceedings, 1958, p. 654–57.) 5 refs.

Discusses linguistic time depth calculations, including the date of separation of

East Greenlandic from West Greenlandic, Greenlandic from East Eskimo, Eskimo from Aleut. The unavoidable inexactitude of glottochronology is stressed and its use as means to reliable dating criticized. ***Copy seen:*** DSI.

49684. BERGSTEN, FOLKE, 1889– . Nederbörden i Sverige, medelvärden 1921–1950. Stockholm, 1954. 21 p. incl. tables, maps. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, ser. C, nr. 5.) 6 refs. Text in Swedish. Summary in English. ***Title tr:*** Precipitation in Sweden; mean values 1921–1950.

The investigation is worked out for hydrological use, particularly to indicate the influence of the screen on precipitation gage measurements. It treats mean annual precipitation only, and is based on records from stations which have been observing with screened gages during at least ten years of the period, several of them in the North (Torne, Lule, etc. river systems); all are tabulated. Total change in measured precipitation from the period 1901–30 to the period 1921–50 is tabulated and the distribution of the annual evaporation in Sweden is shown. Conclusion is offered that there probably has been an increase in fallen precipitation in the woodlands and coastal districts of Norrland of about the same magnitude as in the central and southern parts of Sweden.

49685. BERGSTEN, FOLKE, 1889– . The seiches of Lake Vetter and of Lake Torneträsk. Stockholm, Norstedt, 1930. 23 p. illus., graphs, tables. (Sweden. Meteorologiska och hydrologiska institutet. Publikation, nr. 281.)

Contains results of completed investigations of standing waves in Lake Vetter, central Sweden, and preliminary results of investigations underway in Torneträsk, northern Sweden. Limnographic observations in Torneträsk were made at Abisko (68°21′ N. 18°50′ E.) and Pålnoviken, further north. Theoretical investigations were made by means of the method of rests. Position of the nodes and ventral-lines as well as shape of the wave over the lake as a whole are derived. Examples of seiches registered at Abisko are presented. The amplitudes of waves of first and second order reach a maximum of about 2 cm. An oscillation with a period of about 22 min., appears frequently in the Abisko linograms, but not at all in the Pålnoviken; undulations in the latter of about 27 min. period are lacking in the Abisko records. The character of these waves has not as yet been fixed. ***Copy seen:*** DLC.

Report on animals made hypothermic to 20–15° C. by the method of Giaja (cooling in hermetically closed vessels). The Sayers test does not cause an additional reduction of ascorbic acid and of adrenal cholesterol, in contrast to animals exposed to cold but not made hypothermic. ***Copy seen:*** DNLM.

49698. BERSON, F. A. On the rôle of long-wave instability in the general circulation; a study of five-day means in November 1948. Stockholm, 1950. 13 p. diagrs. (Sweden. Meteorologiska och hydrologiska institutet. Meddelanden, ser. A, nr. 3.) 16 refs.

Five-day mean circulation patterns between longitude 120°W. and 60°E. and latitude of approx. 37°N. and 77°N. are constructed for the 500 mb level. An analysis of the variations during Nov. 1948 verified the theoretical observation that establishment of positive vertical shear of zonal wind concurrent with marked surface easterlies in subpolar latitudes favors development of large amplitudes of planetary waves generated in the zonal current system. The analysis also indicates a relationship between this growth of planetary waves and the formation of jet streams to the south. The data also indicate a southward shift of successive westwind maxima and the existence of distinct poleward and equatorward pressure surges.

49699. BERTHELSEN, ASGER. The structural evolution of an ultra- and polymetamorphic gneiss-complex, West Greenland. (Geologische Rundschau, 1957. Bd. 46, Heft 1, p. 173–85, 6 illus., 3 text maps, diagrs., cross-section.) 18 refs. *Also issued as:* København, Universitet. Mineralogisk-geologiske museum. Communications géologiques no. 84.

Contains results of author's investigations on Tovqussaq Peninsula (64°51′N. 52°05′W.) in 1949, 1953 and 1954 as part of a Grønlands Geologiske Undersøgelse program (1949 work: No. 20637). Regional geology of the west coast 64°–67°N. is briefly described. Structural evolution of the Tovqussaq region involves an orogenic period and subsequent cratogenic period. During the first main cycle of the orogenic period, complicated nappe structures were formed. As metamorphism reached granulite facies conditions, almost complete recrystallization of the rocks took place, and the nappes became refolded. In the second main cycle, under amphibolite facies conditions, the old granulite facies complex became exposed to retrograde metamorphism and granitization. All major fold structures belong to the older cycle. The cratogenic period involved two periods of dyke instrusion separated by formation of the important Fiskefjord faults. Genesis of the gabbro-anorthosites, diorites and "genuine" anorthosites is discussed.

49701. BERTRAM, GEORGE COLIN LAWDER. Arctic and Antarctic; a prospect of the polar regions. Cambridge, Eng., Heffer, 1958. ix, 123 p. illus., plates, maps incl. 1 fold.

New ed. of No. 1490, mostly rewritten to present post-war practice in polar living, transportation, communication, etc. The purpose and technique of polar work and travel are distinguished in three stages: before World War I, 1919-1939, and post-war. Polar animals, cold effects, clothing, sled dogs, transport, food, are dealt with. Problems of expeditionary organization and leadership are discussed, private and government ventures characterized. Polar enterprises are noted as instruments of national policy, and consideration is given to economic, political and strategic as well as scientific aspects of present-day activities in Arctic and Antarctic. IGY stations (56) are shown on antarctic map. A final chapter "Memories" offers vignettes from author's experience in polar life. ***Copy seen:*** DLC.

Reports an appearance of oil in volcanic pipes in the Nizhne-Ilim (approx. 57°15′ N. 103°20′ E.) region and in the Vilyuy basin. In the former, Zheldon III, Zheldon II, Zheldon I, Tat'yanka and Pasmurnyy pipes were investigated and in the Vilyuy region, Mir, Udachnaya and Zarnitsa. The appearance of fluid oil and solid bitumen were investigated in different cross-sections in the pipes themselves and near them. The substance of the oil and bitumen and their mixtures was studied and their chemical compositions are tabulated. Origin and migration of oil are discussed. Its occurrence is evident also in kimberlite pipes of the Olenek region. It is concluded that this oil occurrence in volcanic pipes follows the pattern known in France, Germany, South Africa and elsewhere.

49721. BILELLO, MICHAEL A. A survey of arctic snow-cover properties as related to climatic conditions. Wilmette, Ill., Dec. 1957. 9 p. tables, graphs. (U.S. Army. Corps of Engineers. Snow, Ice, and Permafrost Research Establishment. Research report 39.) 3 refs.

"Data collected over 2–4 yr. in Alaska (five stations) and at seven stations in Baffin and the Queen Elizabeth Islands are analyzed for regional variations in snow-cover density, temperature, and hardness as related to climate. Snow temperatures from Nov.–March averaged 4°–9° C. higher than air temperatures in Alaska and 4.5° C. higher in Canada. Density in Alaska was 0.13–0.20 in Nov. and 0.23–0.27 in March, while in Canada the values ranged from 0.30–0.36 in Nov. and 0.33–0.39 in March. Regional hardness variations resembled those for density. Snow hardness during the period of no melting was found to be related to densities from 0.15–0.36. Nomographs were developed for estimating average monthly snow-cover density from mean air temperature and wind velocity for November–March for the area N. of 62° N. lat. and elevations below 1500 ft. A comparison between observed and derived values indicates that the method provides a reliable regional estimate of snow-cover densities."—SIPRE.

49730. BIRKENMAJER, K. Preliminary report on the raised marine features in Hornsund, Vestspitsbergen. (Polska Akademia Nauk. Bulletin, série des sciences chimiques, géologiques et géographiques, 1958. v. 6, no. 2, p. 151–57.) 9 refs. Summary in Russian.

Reports scattered observations in 1956 and 1957 along the coast of Hornsund (76°30′ N. 15°30′ E.) noting the links between raised marine features and the Hologene history of the Arctic, and isostatic movements depending on stages of glaciation. A table of the main coast features (four terraces) is presented and compared with similar features of central Spitsbergen, described by others. The differences of raised marine terraces, according to the author, are caused by a different rate of postglacial uplift. He proposes a new so-called "whale" method for systematic observations of the Spitsbergen isostatic movements, based on the situation of about a hundred whales' bones, scattered along the Hornsund coast. ***Copy seen:*** DGS.

49731. BIRKENMAJER, K. Preliminary report on the stratigraphy of the Hecla Hoek formation in Wedel-Jarlsberg Land, Vestspitsbergen. (Polska Akademia Nauk. Bulletin, série des sciences chimiques, géologiques et géographiques, 1958. v. 6, no. 2, p. 145–50.) 10 refs. Summary in Russian.

The area (approx. 77° N. 14° E.) between Werenskioldbre, Austre Torellbre, Mühlbaherbre, Hornsund and Dunöysund, in the southern part of Vestspitsbergen, was investigated in summer 1957 by the Polish IGY Spitsbergen Expedition under Dr. S. Siedlecki. It purposes to continue the geologic mapping started by Dr. S. Z. Rożycki in 1934. Discoveries of a new inarticulate brachiopod and trilobite fauna are claimed. A new stratigraphic division is proposed (table). The Hecla Hoek formation consists of Precambrian and Lower Paleozoic rocks with the degree of metamorphosis visibly stronger toward the base. The main orogenic movements are stated to have taken place after deposition of the Ordovician. The geosyncline was of long duration and lasted with some interruption from Precambrian to Lower Paleozoic time. ***Copy seen:*** DGS.

49732. BIRKENMAJER, K. Remarks on the pumice drift, land-uplift and the recent volcanic activity in the Arctic Basin. (Polska Akademia Nauk. Bulletin, série des sciences chimiques, géologiques, et géographiques, 1958. v. 6, no. 8, p. 545–49, map.) 14 refs.

Reviews occurrence and position of pumice fragments in Hornsund, Vestspitsbergen and other places observed by various explorers including the author. He agrees with Kulling's opinion that submarine volcanoes should be regarded as a possible source of the pumice in the arctic marine basin. An attempt is made to date the pumice-lava eruptions at late 15th and mid-18th centuries. A new, (so-called "whale,") method is proposed for calculating the rate of uplift in the Svalbard archipelago. Tentative isobases are drawn for the last 350 years showing the land uplift. Maximum recent uplift is considered to lie in the central part of the Barents Sea shelf. ***Copy seen:*** DGS.

49733. BIRKET-SMITH, KAJ, 1893– . Boulder-chip scrapers in the Eastern Arctic. (Man, July 1958. p. 113–14, illus.) 22 refs.

Discusses the uneven distribution of boulder chips used as skin-scrapers which, while common to Athapaskan and Eskimo sites in Alaska, are rare outside of this area. Only occasional finds of the implement have been made in Prince William Sound and on Chetyrekhstolbovoy Island off the Kolyma River mouth (Siberia). The boulder-chip scrapers are even rarer in the Eastern Arctic, though a few have been discovered in Labrador, in Dorset sites of Newfoundland and as far east as West Greenland where author found them still in use in 1918. ***Copy seen:*** DLC.

49734. BIRKET-SMITH, KAJ, 1893– . Danish activities in Eskimo research, 1949–1954. (International Congress of Americanists, 31st, *São Paolo*, 1954. Proceedings, 1955. v. 2, p. 1119–28.) 22 refs.

Discusses research and recent publications in the fields of physical anthro-

pology, linguistics and prehistory. The ethnological and archeological results of the Fifth Thule and Danish Peary Land Expeditions in Arctic Canada and Greenland, H. Larsen's and J. Meldgaard's excavations in Alaska, etc., are summarized. A Paleo- and a Neo-Eskimo stage in Eskimo prehistory are postulated and H. B. Collins' view of a pre-Ipiutak dating of the Old Bering Sea culture criticized (No. 21277). ***Copy seen:*** DSI.

49735. BIRMAN, I. B. O rasprostranenii i nerestovykh migratsiiakh gorbushi, *Oncorhynchus gorbuscha* Walb. v severo-zapadnoĭ chasti Tikhogo okeana. (Akademiia nauk SSSR. 49740. BISHOP, BARRY C. Shear moraines in the Thule area, northwest Greenland. Wilmette, Ill., Jan. 1957. 47 p. illus. incl. 6 stereopairs and 2 stereotriplets, 6 maps incl. 1 fold., diagrs. (*In:* U.S. Army. Corps of Engineers. Greenland ice cap research program, 1955–56. v. 2. SIPRE research report 17.) 5 refs.

Discusses results of study of an unusual and little-known type of moraine, an ice-cored deposit developed from debris supplied by shear planes at the boundary between the stagnant outer zone and the mobile inner zone of the icecap. It is located on the margin of the inland ice, southeast of Thule, between Moltke and Petowik Glaciers. Physiographic conditions of the study area and structure of the marginal zone of the icecap are treated in some detail; geomorphic processes of ablation, drainage, sorting, sliding and slumping, undermining, and wind action (most striking), and resulting features are described. Recent glacial history of the ice margin indicates at least one complete cycle is represented in the Thule Ramp shear moraine area. Fur-

ther knowledge is needed for determining the age of these moraines.

(Tidsskrift for skogbruk, June 1950. årg. 58, hefte 6, p. 140–45, illus. *Also pub. in:* Skogen, *Oslo*, 1950, årg. 15, hefte 7, p. 89–94.) Text in Norwegian. ***Title tr.:*** The planting trip of young Norwegians to Iceland in the summer of 1949.

Describes trip from Troms county to Iceland to take part in forest planting in many parts of the country. The Norwegians' contribution, especially to cultural exchange between Iceland and Norway, is stressed. ***Copy seen:*** DA.

49746. BJARNASON, HÁKON. Skogkulturen på Island. (Skogbrukeren, Jan. 1, Feb. 15, 1952. årg. 27, nr. 1, p. 1–4; nr. 4, p. 42–43.) Text in Norwegian ***Title tr.:*** Cultivation of forests in Iceland.

Natural forest in Iceland (mainly birch) has been reduced to less than 1,000 sq. km., the trees small, of poor quality, max. height 11 m. Timber used is mostly imported. Conifers of several species

were planted experimentally (1899–1913) but most proved unsuited to the local climate. Various species from Alaska, northern Norway and Siberia have been planted since 1933, and preliminary results are encouraging. ***Copy seen:*** DA.

49747. BIÖRCK, GUNNAR, 1916– , *and* B. JOHANSSON. The influence of anoxia on the hypothermic electrocardiogram of hedgehog and man. (Cardiologia, 1957. v. 30, no. 5, p. 344–48, illus.) 4 refs.

Contains description and discussion of electrocardiograms from hypothermic hedgehogs and men whose hearts were subject to anoxia. In man this was induced by circulatory arrest, in the hedgehog by breathing N. The fact that hypothermic hedgehogs are able to breathe N for two hours without ill effect against only 3–5 minutes in the normothermic state is pointed out and discussed. ***Copy seen:*** DNLM.

49748. BJÖRCK, PEDER, 1891– . En påskfärd till Karesuando. (Svenska turistföreningen. Årsskrift, 1926. p. 249–62, illus.) Text in Swedish. ***Title tr.:*** An Easter journey to Karesuando.

Describes a ten-day visit to Karesuando, in northern Sweden, Apr. 1925: the 140 km. sled journey from Kiruna; Lappish schools, homes, clothing, food, and customs; importance of reindeer migrations, etc. ***Copy seen:*** DGS.

49749. BJÖRKMAN, ERIK, 1912– . Norrländsk tallkräfta (*Dasyscypha fuscosanguinea*) i sådder och planteringer i höjdlägen. (Skogen, *Stockholm*, Aug. 15, 1957. årg. 44, nr. 16, p. 522.) Text in Swedish. ***Title tr.:*** Norrland pine cancer (*Dasyscypha fuscosanguinea*) in seedlings and forest plantings in high altitude areas.

This fungus, known as a parasite in older pine stands, also invades pine seedlings and young trees at 400–700 m. altitude. It invades the collar of a young tree injured by frost heaving; other fungi and insects follow and the tree gradually dies. *Dasycypha fuscosanguinea*, a serious threat to reforestation, should be strictly controlled. ***Copy seen:*** DA.

49750. BLACK, RICHARD BLACKBURN, 1902– . Richard Evelyn Byrd. (Geographical review, Oct. 1957. v. 47, no. 4, p. 579–81, port.)

Obituary of this American explorer, in charge of the United States Antarctic program of the IGY, at his death, Mar. 11, 1957. His pioneering use of aircraft in polar regions, recognition of the advantages of motorized surface transport and use of radio communications for field parties is stressed. In 1925 he led the Navy flying contingent of the MacMillan Expedition and in 1926 flew over the North Pole from a base in Svalbard. His antarctic expeditions from 1928 to 1957 are noted. Another obituary of Byrd by the same author was pub. in *Explorers journal*, Oct. 1957, v. 35, no. 3, p. 1–7. ***Copy seen:*** DGS.

49751. BLACK, ROBERT FOSTER, 1918– . Gubik formation of Quaternary age in northern Alaska. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, pt. 2, p. 1701.)

Contains abstract of a paper presented at the Society meeting in Atlantic City, Nov. 1–3, 1957. Describes unconsolidated formation, largely comprising lenses and admixtures of silt and fine-grained sand with quartz and chert predominating, which mantles rocks of Cretaceous or Tertiary age throughout the Arctic Coastal Plain Province. Three lithologic units are distinguished.

Copy seen: DGS.

49752. BLACK, ROBERT FOSTER, 1918– . Permafrost, water-supply and engineering geology of Point Spencer Spit, Seward Peninsula, Alaska. (Arctic, 1958. v. 11, no. 2, p. 102–116, illus., 2 maps, 3 diagrs., table.) Paper read at Geological Society of America meeting Oct.–Nov. 1956, abstract was listed as No. 44040.

Contains results of geologic reconnaissance of the spit, autumn 1945, by author and William P. Brosgé, to determine the character of the permafrost and the availability of potable water for use by a construction group and a service group of the U.S. Army Corps of Engineers. The geography, geology, climate, permafrost conditions, engineering, geology and hydrology of the area are treated in turn. Spits like Point Spencer can be classed among the barrier-bars or offshore bars; supply of fresh water in such areas is always limited; permafrost is the factor which permits its preservation in natural or artificial basins, and this must be considered in planning construction.

Copy seen: CaMAI.

49753. BLACK, ROBERT FOSTER, 1918– . Some problems in engineering

geology caused by permafrost in the Arctic Coastal Plain, northern Alaska. (Arctic, 1957. v. 10, no. 4, p. 230–40, illus.) 40 refs.

Deals with permafrost as the controlling influence on certain engineering projects as observed during field studies, 1945–1951. Its direct and indirect effects on transportation, surface and underground exploration, construction and durability of structures, water supply, sewage disposal, drilling for and production of oil and gas are considered, but no attempt is made to present an overall survey. "Overland transportation is hampered most in the spring breakup and fall freeze-up periods; excavation can be made only in summer in the active layer unless special methods are used. Bench marks can be set properly only in adequately drained backfill to 10 m. depth. Foundation excavations must be kept nearly dry; construction material for roads is lacking except locally. Steel landing mats and concrete can be used safely on gravel beaches for landing strips; small airstrips can be built on sand dunes with little grading and little danger of affecting the permafrost. A frozen runway of pycrete or icecrete utilizing turf and surface soil as the foundation and permafrost as a cold reserve in a heat exchanger is recommended for areas lacking suitable materials."—SIPRE.

49754. BLACK, ROBERT FOSTER, 1918– , *and* W. L. BARKSDALE. Terrain and permafrost Umiat area, Alaska. Sept. 1948. 23 p. illus, graphs, maps incl. 1 fold. (U.S. Geological Survey. Military Geology Section. Permafrost program progress report no. 5.) 5 refs. In cooperation with Research and Analysis Branch, Engineer Intelligence Division. Chief of Engineers Office.

Contains a brief description of the topography, drainage, climate, vegetation, geology, hydrology and permafrost in this area of the Arctic Plateau (Arctic Slope) of Alaska. Two terrain units, the flood plain of the Colville River, and adjacent bedrock hills are discussed in relation to soils and rock materials, vegetation, permafrost and construction considerations. Umiat (new camp) and the airstrip lie on the north bank of the Colville River at approx. 69°22′ N. 152°08′ W. Areas of coarse-grained material favorable for airfield construction are widely scattered and limited in extent. Damage from frost action (to the 1944 camp and airstrip) and permafrost conditions are described.

49756. BLACK, WILLIAM A. Population distribution of the Labrador coast, Newfoundland. (Canada. Dept. of Mines and Technical Surveys. Geographical Branch. Geographical bulletin, 1956. no. 9, p. 53–74, 6 text maps, 8 tables.) 7 refs.

Report based on field work carried out summer 1950 and autumn 1952, on Newfoundland (1911–1945) and Canada (1951) census data, etc. Population growth and distribution have depended upon the fisheries since 1785, when there were 153 permanent residents along the coast. Establishment of mission and hospital centers, growth of fur-trapping communities in the Lake Melville area, and of settlements of summer and winter fishers, also establishment of Goose Bay air terminal have contributed to population growth and its concentration into fewer centers. Migration, especially among the Eskimo and Indians, continues despite government efforts to reduce it. Seasonal fishing and dwelling are likely to persist. ***Copy seen:*** DLC.

49757. BLACK, WILLIAM A. A report on sea ice conditions in the Eastern Arctic, summer, 1956, 1957. Ottawa. Queen's Printer, 1957, 1958. 2 no.: 32, 32 p. illus., tables, text maps. (Canada. Dept. of Mines and Technical Surveys. Geographical Branch. Geographical papers, no. 9, 15.) 7 refs. in no. 15.

Reports ice reconnaissance surveys from the northern supply ship CGS. *d'Iberville*, part of the Geographical Branch program to collect data on sea ice conditions and distribution in Canadian waters. Ship-board observations were supplemented by aerial ice reports. General ice and weather conditions are described for August 1956 and Aug. 1–Sept. 6, 1957, en route to Resolute and Eureka; ice distribution and contributing factors are discussed, summarized in tables, shown graphically on maps, and illustrated. Importance of aerial ice reports is stressed. ***Copy seen:*** DGS.

A study of 23 hypothermic patients. Blood pressure, pulse rate and its relation to temperature, points of disappearance of blood pressure and pulse, venous pressure, conditions during rewarming, cardiovascular reflexes, etc., are recorded and analyzed. ***Copy seen:*** DNLM.

49766. BLAIR, JOSEPH R., *and others.* Sequelae to cold injury in one hundred patients; follow-up study four years after occurrence of cold injury. (American Medical Association. Journal. Apr. 6, 1957. v. 163, no. 14, p. 1203–1208, illus., tables.) 9 refs. *Other authors:* R. Schatzki, *and* K. D. Orr.

A study of a representative group out of some 5,600 cases evacuated from Korea during the winter 1950–51. Initial observations of these patients began on the average six days after the injury. Following symptoms (in order of frequency) were found in the present investigation: excessive sweating; pain; cold feet; numbness; abnormal color and joint symptoms. Typical physical findings include: tissue loss and scarring, abnormal nails. X-ray examinations revealed transient osteoporosis; mutilation of terminal phalanges; cyst-like bone defects; new periosteal bone formation and growth disturbances in patients with open epiphyses. ***Copy seen:*** DLC.

Detailed study of origin and physical characteristics of the surficial deposits of

the Lake Melville area, carried out in 1952–1953, as part of project for the Canadian Defence Research Board under supervision of F. K. Hare. Melville, largest lake in Labrador, occupies a downfaulted block, or graben; to the south is the Mealy Mountain Range, an uplifted block of intrusive anorthosite-gabbro. Hydrography, marine and river terraces, varved clays along the Naskaupi River which contain many concretions, fossil trees, are described. Raised beaches are common; locally, sand dunes are numerous. Glacial till which covers most of the area has in many places been formed into drumlins; eskers are uncommon; end moraines occur in two places; other glacial features are found, often covered by vegetation.

A study of eight dogs during progressive temperature fall and during a period of low stable temperature, induced by immersion in ice-water. The overall results suggest a direct, depressant effect of low temperature upon the kidney, accompanied by cardiovascular and metabolic changes. The effects, however, were not all functionally correlated and rather the result of the cold-impact on all body tissues, according to the van 't Hoff law. ***Copy seen:*** DNLM.

49772. BLATTEIS, CLARK M., *and* **S. M. HORVATH.** Renal hemodynamics and function during hypothermia. (Federation proceedings, Mar. 1957. v. 16, no. 1, pt. 1, p. 12–13.)

Report on experiments with dogs. No changes in renal functions were observed until rectal temperature fell by some 3° C. Subsequently rate of glomerular filtration, renal plasma flow and tubular excretion of PAH decreased, first concomitantly and finally independently of body temperature. Tubular filtration remained unchanged; urine output first rose then fell below control levels.

BLÎÂKHER, S. L., *see* Kurilova, L. M., *and* S. L. Blîâkher. O svoĭstvakh kholodovykh . . . tochek. *1958.* No. 52578.

49773. BLISS, L. C. A comparison of plant development in microenvironments of arctic and alpine tundras. (Ecological monographs, Oct. 1956. v. 26, no. 4, p. 303–337, illus., tables.) About 100 refs.

Account of studies made in 1953 around Umiat (69°22′ N. 152°10′ W.) northern Alaska and in the alpine tundra of the Medicine Bow Mts. of Wyoming. Environmental factors measured in both areas include: solar radiation; air, surface and soil temperatures; precipitation; wind, etc. The composition and character of the two floras were studied and compared and plant growth measured in terms of stem elongation and leaf expansion. Phenological events of the dominant forms were also followed throughout the growth season. In general it is concluded that the alpine tundra studied represents in most aspects a more severe environment, which is reflected in the smaller and more scatttered plants. ***Copy seen:*** DLC.

49774. BLISS, L. C. Seed germination in arctic and alpine species. (Arctic, 1958. v. 11, no. 3, p. 180–88, illus., tables.) 19 refs.

Account of germination tests made with the aim of ascertaining seed viability of plants from the arctic tundra of Alaska (near Umiat, 69°22′ N. 152°10′ W.) and the alpine tundra of Wyoming. A greater proportion of the latter germinated (of 26 species, 21 i.e. 80%; of 36 arctic species, 22 or 61%); though individual species from both tundras showed a high percentage of germination. Conditions affecting germination, influence of light and darkness, wetness, etc., are analyzed. ***Copy seen:*** CaMAI.

49783. BOBRIEVICH, A. P. K petrografii ul'traosnovnykh vklûcheniĭ v kimberlitakh vostochnoĭ Sibiri; Amakinskaîa ėkspediţiîa. (Razvedka i okhrana nedr, Jan. 1957. god 23, no. 1, p. 6–12, illus.) 2 refs. Text in Russian. ***Title tr.:*** Petrography of the ultrabasic inclusions in the kimberlites of Eastern Siberia; Amakin expedition.

Characteristics of various inclusions in the kimberlite pipes of Yakutia are described with macroscopic illus. Considerable accumulations of picritic porphyrites were found with and without phlogopite and with definite porphyritic structure and fluidal texture. The basic mass consists of small idiomorphic pseudomorphoses of serpentine and carbonates in olivine, microlites of pyroxene and fine flakes of phlogopite. The phlogopite was of two types: large elongated idiomorphic tablets and small elongated scales in the basic mass. Various other forms and combinations of mineral inclusions are characterized. ***Copy seen:*** DLC.

511326—60——10

Title tr.: Dehydration of concentrate at an Olenegorsk plant.

Reviews an ore-dressing problem at this mining center on Kola Peninsula. Difficulties in filtration and separation of fine crushed concentrate which appeared in operation of the dehydrating equipment, as originally designed, are described in detail and with tabulated granulometric characteristics. Auxiliary dehydration with a single spiral or slotted screen classifiers and hydrocyclones, installed before filters, were found unsatisfactory due to the high water content (17–18%). A concentrate arrangement is adopted in the form of a large storage pile, from which water gradually flows out and into the collector by its own gravity. Various views and cross sections of the building with the dehydration arrangement and other equipment are shown. ***Copy seen:*** DLC.

49800. BÖLIN, P. GÖSTA. Moderna havsisbrytare i Östersjön. (Teknisk tidskrift, Oct. 28, 1958. årg. 28, häfte 39, p. 1025–32, diagrs.) 24 refs. Text in Swedish. ***Title tr.:*** Modern ice-breakers in the Baltic Sea.

Summarizes experience gained in the 1957/58 winter season with the Swedish ice-breaker *Oden*, and compares effectiveness of this diesel-electric, four-propeller type with other major ice-breakers. Its main superiority over older models lies in its ability to break thick ice continuously without stopping and backing to regain speed. With the hull shape now generally accepted as standard for ice-breakers, additional ice-breaking effects can be realized only through increased displacement and engine power. Arrangements of propellers: number, types, direction or rotation, fixed vs. adjustable blades, etc., are discussed; power distribution on fore- and aft propellers, and the technical and economic aspects of a few large vs. several small diesel engines are considered. Automatic adjustment of engine moment and effect to given moment- and effect-requirements of the propeller by varying speed of rotation, is discussed; maneuvering arrangements, accommodations, and other equipment of the *Oden* are described and evaluated. ***Copy seen:*** DLC.

49801. BÖLIN, P. GÖSTA. Statsisbrytaren Oden, vår stärkaste isbrytare. (Tidskrift i sjöväsendet, Jan. 1958. årg. 121, häfte 1, p. 66–70, illus.) Text in Swedish. ***Title tr.:*** The Government ice-breaker *Oden*, our strongest ice-breaker.

Describes Sweden's newest and largest ice-breaker. Delivered from Sandvikens Skeppsdocka, Helsinki, in Nov. 1957, the ship has four propellers driven by diesel-electric engines of 10,500 s. hp. Length o.a. is 83.35 m. and displacement 5260 $m.^3$. *Oden's* ice-breaking capabilities are briefly discussed and a comparison is made with *Ymer*, the second largest Swedish ice-breaker. ***Copy seen:*** DLC.

"The propagation of ultrasonic waves in ice is analyzed mathematically; a method of measuring ice thickness ultrasonically is described; and the results of laboratory and field tests are reported. The velocity of longitudinal sound waves was measured by 500-kc. barium titanate transducers. The velocity of longitudinal waves in the temperature range 0° to −25° C. varied 10% for 60 x 60 x 60-cm. fresh-water samples tested in the laboratory, while for similar samples of sea ice it depended on salinity. The maximum error in field measurements on lake ice 1 m. thick and layered ice blocks 90–140 cm. thick did not exceed 5%. Field tests also showed that freshwater ice up to 2 m. thick and polar sea ice up to 0.8–1 m. thick can be measured fairly accurately using a frequency of 500 kc. The method can also be used in the study of the structural characteristics and elastic properties of various kinds of ice. Data are tabulated and graphed on the relation between longitudinal sound wave velocities and ice temperature and salinity, and wave velocities and ice thicknesses measured in the field."—SIPRE.

Discusses properties of Hycar nitrile rubbers, to be manufactured in Great Britain. Low-temperature flexibility, and the effect of oil and gasoline on the volume change are shown. Though inferior to natural rubber in low-temperature resistance, a high acrylomitrile polymer can remain operative as low as −70° C. when in contact with lubricating oil, whereas −20° to −30° C. is the usual limit for the material in air. ***Copy seen:*** DLC.

49821. BOLLER, KENNETH HAROLD, 1911– . Strength of wood at low temperatures. (*In:* U.S. Quartermaster Food and Container Institute for the Armed Forces, Chicago. Low temperature test methods and standards for containers, 1954. p. 65–80, illus., graphs.) Ref.

Test results on various types of wood and wood containers are reviewed; testing equipment is described and illustrated. Wood is generally stronger at lower temperatures, from 1.25 to 3.5 times as strong depending on the property involved. Other factors, such as moisture content, imperfections, and fastenings must be considered along with the temperature effect in practical application. In general, wood products do not lose strength as a result of subnormal temperatures.

Account of the construction of two types of automatic meteorological stations for use in the Arctic: the Alekseev radiobeacon (radiovekha Alekseeva) and

DARMS (Dreĭfuûshchaîa avtomaticheskaîa radiometeorologicheskaîa stant͡siîa: Drifting automatic radio-meteorological station), both devised by I͡U. K. Alekseev and built in the Construction Bureau of the Arctic Institute. The radio-beacon was tested in May 1952 on an ice field 250 km. northeast of Cape Chelyuskin, and many of this type have been set up on drifting ice in the Arctic Basin, Kara Sea and other arctic areas; these stations are quite reliable, and one set up in May 1955 northwest of the New Siberian Archipelago, is still working. Messages sent automatically at preestablished intervals, contribute considerably to the weather service; together with other data, they enabled Soviet scientists to forecast the unfavorable ice conditions on the Northern Sea Route in 1956. Another, improved type of automatic station, DARMS, was worked out in 1953–55 and tested in 1956 in the area of 87° 52′ N. 187°28′ E. Externally, DARMS is similar to the first type and differs mainly in that it can send information at any time on "call" from coastal stations; its construction is briefly described and figured; the accuracy of its information is noted. Geophysical explorations to be carried out in over a hundred Soviet polar and drifting stations during the IGY are briefly outlined by V. F. Burkhanov in a foreword. ***Copy seen:*** DLC.

Institut merzlotovedeniĭa.) 39 refs. Text in Russian. ***Title tr.:*** Structural deformations in the Vorkuta region, their causes, and methods of prevention.

Outlines the relief, geology, hydrogeologic, climatic and permafrost conditions in the region 67°10′–68° N. 63°20′–65° E. and reviews building methods in Vorkuta and Bol'shezemel'skaya Tundra during the period 1937–1951. "Structural deformations observed 1937–1951 are described in detail. Of 165 heated and unheated structures inspected, only 35 (21 brick, 14 wooden) were undamaged. Several were completely destroyed because of poor construction and maintenance. Much of the damage can be traced to the erroneous assumption that a general degradation of permafrost was in progress. Some thaw damage was caused by snow-drift-interference with air circulation or by sewage. The undamaged buildings were erected on rock, thawed ground, or on frozen dry sand and gravel. Buildings with foundations that allowed uneven settling also remained undamaged. Permafrost conservation should be the basic construction method for the region."—SIPRE. ***Copy seen:*** DLC.

49830. BONDAREV, PETR DMITRIEVICH. Osadki pri ottaivanii l'distykh gruntov poĭmy r. Obi v ra͡one Salekharda. (Akademiĭa nauk SSSR. Institut merzlotovedeniĭa. Trudy, 1958. t. 14, p. 70–79, tables, diagrs.) 5 refs. Text in Russian. ***Title tr.:*** Settling by thawing of ice soils in the Ob' River valley in the Salekhard region.

Reports studies in 7- and 9-m. deep pits on the settling, textural changes, and moisture variations of permanently frozen grayish-blue clay soil of varying ice content, when thawed with steam points. Frozen ground of a high ice content settled on thawing under its own weight as a result of the melting of ice layers and lenses, but did not fully compress, and its moisture content decreased slightly; the magnitude of the settlement depended on the amount and form of ice inclusions. Soil with a small amount of ice cement and a moisture content of 30% expanded due to the swelling of the mineral particles, and its moisture content increased slightly. Maximum settling, settling under own weight, and under compression are calculated, and correction coefficients for grayish-blue clay soils are determined.—From SIPRE. ***Copy seen:*** DLC.

49832. BONNER, CLIFFORD M. Snow, frost and ice removal equipment. Wright-Patterson Air Force Base, Ohio, June 18, 1953. 30 p. illus., 7 p. charts (fold.) U.S. Wright Air Development Center. WADC technical note WCLE–53–130).

Reports progress to June 1, 1953, in the investigation of snow, frost and ice removal equipment and procedures for aircraft, carried out at Wright Air Development Center, Ohio. Methods used in Norway and Canada, and by the Alaskan and Northeast Air Commands are summarized. The Type A–1 Deicing Fluid Spray Outfit has appeared promising operationally; small-scale tests with infra-red heating are not favorable for USAF use; tests with high velocity air blast furnished by a gas turbine compressor have been promising. Various methods are summarized in turn under the

main categories of: Chemical de-icing, water, water- and ice-phobic materials, internal heat, external heat, covers, other means, and equipment. Advantages and disadvantages are listed, and recommendations are made. Other, related military projects are listed. Photographs show seven arrangements of movable spray-equipment.

49835. BORBERG, FINN. Grønlands Handel - det aeldste rederi. (Grønland, Aug. 1957, nr. 8, p. 309–320, illus.) Text in Danish. ***Title tr.:*** The Greenland Trading Company, the oldest shipping company.

Lists and describes some of the ships owned by this Danish company since 1797 (latterly by the state). The first steel ship was built in 1905; in 1926 the last sailing-ships were scrapped and the motor vessel without sail was introduced. The last wooden vessel was built at the end of the nineteen-forties. The company's vessels made 83 Greenland trips in 1956, ten of them to the east coast; 3,699 people were transported in 1951; in 1956: 5,800. It aims to handle 60% of the Greenland-bound freight. A new ship is being planned at present.

49837. BORBERG, FINN. Ny aera i grønlands-sejladsen indledes med KGH's nye skib. (Atuagagdliutit: Grønlandsposten, July 21, 1958. Ukiut 98-iat, nr. 14, p. 10–13, 15–16, illus.) Text in Danish and Eskimo. ***Title tr.:*** A new era in Greenland navigation is introduced with the Royal Greenland Trading Company's new ship.

Contains a detailed description of the 60-passenger vessel, built at Fredrikshavn, Denmark, to go into service in Jan. 1959. It is to carry a Bell 47 D helicopter to aid ice navigation and to be painted orange for easy sighting. The ship is of steel with welded 25 mm. plates riveted to the frames, diesel-powered, average speed of 14 knots and can be navigated from a closed-in, heated crow's nest. It will make 11–12 voyages a year.

Lists and gives details on privately-owned ships chartered by the Greenland Trading Company: one in 1939, 28 in 1956. ***Copy seen:*** DLC.

49840. BORDEN, CHARLES E. Facts and problems of Northwest coast prehistory. (Anthropology in British Columbia, 1951. no. 2, p. 35–52, illus. on 2 unnumb. appended plates, table.) 22 refs.

Supports F. de Laguna's (No. 3829) and H. B. Collins' (No. 3332) assumption that an early Eskimo stratum underlies Indian cultures of southern British Columbia and northwestern Washington State. The Nootka are suggested as first Indians to settle on the coast in preference to the Eyak, Tlingit, Haida, Tsimshian or Kwakiutl. Eskimo traits in Nootka whale-hunting practices are discussed and tabulated; close relationship is noted to North Alaskan Eskimos in technical aspects and to Aleut-Koniags in ritual elements of whaling. The southward spread of an early Eskimoid culture along the Pacific coast is speculated upon. ***Copy seen:*** DSI.

Contains a study of humic substances which form an important part of the organic deposits of the Bering Sea. The amount fluctuates from .08 to 1.02% and the mean is .38% of the dry weight of the deposits. Table 1 shows their content and the humic coefficient of various deposits. The coefficient ranges from 16.8 to 39.8 %, the mean amount is about 26%. The humic substances may be divided into five groups (from .2 to .8%) the distribution of which is shown (fig. 2). These substances are characterized by their comparatively high content of hydrogen and nitrogen (tables 2–3), the amount of N fluctuating from 1.97 to 3.84%. About 13% (average) of the whole amount of N in all deposits of Bering Sea are tied in humic substances. ***Copy seen:*** DLC.

49842. BORENIUS, GUSTAF. Blommor och fåglar i Sarek; några minnen från en sommarvandring. (Sveriges natur. Årsbok 1956. årg. 46, nr. 3A, p. 77–82, illus.) Text in Swedish. ***Title tr.:*** Blossoms and birds in Sarek; some recollections from a summer excursion.

Bird life and flora are noted on a summer tour across the lower Sarek region in north Sweden. Among some twenty birds identified (by common name) is a thrush (*Turdus torquatus*) previously unreported north of Umeå. Several of the many plants cited were found at unusually high elevations: *Saxifraga oppositifolia* and *S. nivalis* above 1900 m., and *Ranunculus glacialis* above 2,000 m. in the Kebnekaise region. A correlation between certain species and lime-rich rocks is noted. The larva damage to mountain birch (serious) could not be estimated until another summer. ***Copy seen:*** DLC.

49843. BORENIUS, GUSTAF. Klätterkurs och bestigningar 1957. (Till fjälls, 1957. årg. 29, p. 79–81.) Text in Swedish. ***Title tr.:*** Climbing course and ascents in 1957.

Includes ascents made in north Sweden (about 20) and by Swedes in Norway (five) and Greenland (five). Dates, participants, and short route descriptions are given. ***Copy seen:*** DLC.

Issledovaniîa moreĭ SSSR, 1933. vyp. 18, p. 91–99, diagr.) 17 refs. Text in Russian. Summary in German. ***Title tr.:*** The ionization balance in the Barents Sea region.

Measurements at three different locations showed an average time of existence of 116.3 sec. for the ions. Average number of normal ions was 553/cm.^{3}, and average intensity of ion formation, 407 pairs/cm.^{3} sec. The determination of an equation for ionization balance and for the coefficient of ion destruction is explained; the apparatus used for the measurements

is described. Computed average number of normal ions, 477 cm.,^{3} is considered to be in satisfactory agreement. Relatively larger ion concentration at sea at a low formation intensity is ascribed to a more prolonged ion duration over sea than over land. ***Copy seen:*** DLC.

49845. BORISKOVSKIĬ, PAVEL IOSIFOVICH, 1911– . Izuchenie paleoliticheskikh zhilishch v Sovetskom Soĭuze. (Sovetskaîa arkheologiîa, 1958, no. 1, p. 3–19, illus.) Refs. Text in Russian. ***Title tr.:*** The study of paleolithic dwellings in the Soviet Union.

Discusses the construction materials (bone, stone, wood and hides), building techniques, ground plans and shapes of paleolithic surficial and pit dwellings, including those at Buret' on the Angara River, p. 8 (cf. No. 53740).

49848. BORISOV, P. Mozhno li ispravit' klimat? (Vokrug sveta, Apr. 1958, no. 4, p. 2–6, illus., maps.) Text in Russian. ***Title tr.:*** Is it possible to improve the climate?

Outlines plan to temper the Arctic Basin by pumping out cold water at 500 cu. km./day over a dam built across Bering Strait, and letting the warm masses of Atlantic water flow into it. A general temperature rise in the Northern Hemisphere is anticipated; such "war against cold" is claimed to be feasible and the cost of the dam construction and pumping installations is estimated at 100–110 billion rubles. Several Soviet scientists, including I. D. Papanin, comment on this plan in the next issue of this magazine (no. 5, p. 7); it was criticized by D. Drogaĭtsev, q.v. ***Copy seen:*** DLC.

49849. BORISOV, P. A. Karel'skie shungity, tsennoe iskopaemoe. (Razvedka i okhrana nedr, Mar. 1957. god 23, no. 3, p. 12–19, illus., graphs, map.) Text in Russian. ***Title tr.:*** Karelian shungite, a valuable mineral.

Attempts to develop shungite deposits of various carbon concentration (5–98%) for industrial use are reviewed since 1870. Shungite is classified in five categories according to carbon concentration: 90–98, 55–75, 34–37, 10–30, and 5–10% C. Large deposits of shungite of 34–37% C with heat value of 3000–4000 cal./kg. were found, but it was not adopted for fuel due to the appearance of liquid slag covering the burning mass. Shungite slates are generally used for other industrial purposes: in metallurgy, electrical engineering, for fire- and acid-resistant products, mineral paints, jewelry and even in agriculture. Shungite slates contain various minerals (quartz, mica, spar and microelements such as V, Mo, Cu, Ni, B, W, Co, etc. These deposits are shown in sections, and located on map: various developments are described in text. ***Copy seen:*** DLC.

Text in Russian. ***Title tr.:*** Main features of the structure and composition of pegmatite vein formation in Khibiny massif, and the question of its genesis and classification.

Results of investigation of the geologic and genetic interrelation of vein formations in this area are presented from material collected by the author. Formations represented in the structure of Khibiny massif are reviewed. Two groups of pegmatite veins are distinguished: syngenetic and epigenetic. Both groups are treated in detail and features of their mineral composition are outlined. General principles of pegmatite classification are discussed. The classification itself is presented in tables. ***Copy seen:*** DLC.

49853. BOROVIK-ROMANOVA, TA-T'ÎANA FEDOROVNA, *and* **E. D. KALITA.** O t͡sezievo-rubidievom mikroklinpertite i rasprostranenii v nem redkikh shchelochnykh metallov. (Geokhimiîa, 1958, no. 2, p. 107–114, illus., tables.) 11 refs. Text in Russian. Summary in English. ***Title tr.:*** On cesium-rubidium microcline-perthite and the distribution of rare alkali metals in it.

Describes microcline-perthite from pegmatite of Kola Peninsula. Its rubidium content ranges from 1.08 to 1.6% and cesium from 0.11 to 0.14%. On comparison with samples from the Khibiny, the Urals, Karelia and other regions, the Kola microcline-perthite is found many times richer in rubidium and cesium than the others, and should be called cesium-rubidium microcline-perthite. A certain regularity in the rubidium distribution is established according to depth within the pegmatite. ***Copy seen:*** DLC.

49854. BOROVIK-ROMANOVA, TA-T'ÎANA FEDOROVNA, *and others.* Ob otnoshenii soderzhaniĭ kaliîa k rubidiîu v mineralakh iz pegmatitovykh zhil Kol'skogo poluostrova po dannym spektral'nogo analiza. (Geokhimiîa, 1958. no. 4, p. 334–41, table, diagrs.) 11 refs. Text in Russian. Summary in English. *Other authors:* A. F. Sosedko, and E. N. Savinova. ***Title tr.:*** On the ratio of potassium and rubidium content in minerals from pegmatite veins of the Kola Peninsula according to data of spectral analyses.

Microclines and micas of pegmatite veins with differing paragenetic associations in northern Kola Peninsula were studied. In 30 samples of microclines, the K/Rb ratio varied from 106 in ordinary veins to 7 in the more complex; from nine samples of micas, the ratio varied from 13.4 to 3.6. Zonality of the pegmatite field affects the K/Rb ratio. The gradual accumulation of rubidium and other rare elements in the microclines and micas may be explained by gradual differentiation during cooling of the residual magma. ***Copy seen:*** DLC.

49855. BOROVIK-ROMANOVA, TA-T'ÎANA FEDOROVNA, *and* **A. F. SOSEDKO.** Soderzhanie redkikh shchelocheĭ v mineralakh iz pegmatitovykh zhil Kol'skogo poluostrova po spektral'nym analizam. (Geokhimiîa, 1957, no. 5, p. 368–79, illus., tables, diagrs.) 17 refs. Text in Russian. Summary in English. ***Title tr.:*** The content of rare alkalis in minerals from pegmatite veins of the Kola Peninsula according to spectral analyses.

Presents data on distribution of lithium, rubidium and cesium in microclines and micas taken from pegmatite veins in the Leshaya Mountain region of northern Kola. Analyses of the Li, Rb, Cs content are presented. Zonality of the rare alkali content as disclosed and illustrated in map, is lowest in the northwestern part of the region and the highest in the southeast. ***Copy seen:*** DLC.

49870. BOWMAN, WALDO. Build-up for better transarctic bases. (Engineering news-record, Feb. 1957. v. 158, no. 6, p. 30–43, illus.)

Describes prevailing construction and research at U.S. military bases and camps in Greenland. The Thule program includes a huge apron and widening of runway and taxiways, both paved with asphaltic concrete on an 8-ft. layer of gravel: 80 x 1,800 ft. tar-rubber strips are laid in the jet-plane refuelling areas. Ten new buildings are to be constructed, and the roofs of 85 barracks improved. Research teams at and on the icecap beyond Thule study construction and transportation problems; an experimental road from the coast up and onto the icecap is under construction. Some 3,000 ft. of tunnel have been drilled in the ice for housing and storage purposes, or as an access to the icecap. In Søndre Strømfjord, construction projects include buildings and 15,000 ft. of water mains. Here, as well as at Thule, extensive use is made of Schokbeton, a Dutch concrete of unusual density and strength.

49871. BOWSHER, ARTHUR LEROY, 1917– , *and* J. T. DUTRO, *Jr.* The Paleozoic section in the Shainin Lake area, central Brooks Range, Alaska. Washington, D.C., U.S. Govt. Print. Off., 1957. 39 p. illus., 2 maps, incl. 1 fold, 7 diagrs., table. (U.S. Geological Survey. Professional paper 303–A. Exploration of Naval Petroleum Reserve No. 4 and adjacent areas, northern Alaska, 1944–53, pt. 3, areal geology.) 22 refs.

The Paleozoic section exposed in this area (approx. 68°20′ N. 151° W.) is divided into five formations, four of which have not been described before. The Kanayut conglomerate, 3,300 ft. thick, of Late Devonian age, overlies an unnamed shale and sandstone formation, also Late Devonian. The overlying Kayak shale, 960 ft. thick, consists chiefly of black shale of Mississippian age. The Lisburne group, about 2,200 ft. of fossiliferous bioclastic limestone and dolomite, is composed of two formations; the Wachsmuth limestone (early Mississippian) and the Alapah limestone (late Mississippian). "Structurally the area is characterized by imbricate thrust faulting and high-angle reverse faulting. Mississippian rocks apparently represent plat-

form-type deposition in an east-trending late Paleozoic seaway."

Some 835 specimens were ringed during 1946–1958 in West Greenland, between 64° to 72°30′ N. Recovery series in 1946–50 and the distribution are tabulated. This goose resembles other populations of *Anser* in the mortality experience of adults and of young birds after fledging. ***Copy seen:*** DSI.

49874. BOYD, WILLIAM L. Microbiological studies of arctic soils. (Ecology, Apr. 1958. v. 39, no. 2, p. 332–36, illus., tables, map.) 10 refs.

Report on investigation of soils from the vicinity of Point Barrow, Alaska, Oct. 1955–Dec. 1956. Highest counts of plates (incubated at 22° C.) were made when the soil was frozen; a sharp drop was noted once the summer thaw set in. Part of the population was able to grow at 2° C. Preliminary experiments suggest that limited microbial activity takes place in the soil during the summer.

49875. BOYLE, ROBERT WILLIAM, 1920– . The geology and geochemistry of the silver-lead-zinc deposits of Galena Hill, Yukon Territory. Ottawa, Queen's Printer, 1957. 41 p. text map, fold. map, plans, tables (Canada. Geological Survey. Paper 57–1.) 43 refs.

Summary report of author's 1955 field work on the silver-lead-zinc deposits of this area, completing program started in 1953. Topography, glacial and frost action, climate, general geology and rock types are noted. Of three formations underlying Galena Hill, the Central Quartzite contains the most important ore deposits. Vein faults and fault systems are discussed in some detail, illustrated by plans and located on fold. map. Geochemistry of the deposits is briefly treated; these deposits are similar to those on Keno Hill. Mineralization history of Galena Hill has been long and involved: at least three hypogene stages and a supergene stage still in progress. Lead, zinc, and silver contents of oxidized and unoxidized lodes are shown in table.

49876. BOYLE, ROBERT WILLIAM, 1920– , *and* C. B. CRAGG. Soil analyses as a method of geochemical prospecting in Keno Hill – Galena Hill area, Yukon Territory. Ottawa, Queen's Printer, 1957. 27 p. text map, 2 fold. maps, tables, diagrs. (Canada. Geological Survey. Bulletin 39.) Refs.

Results of research carried out summer 1955, using soil analyses to determine the dispersion characteristics of lead, zinc, and copper from lead-zinc-silver lodes. Previous studies (No. 38962, 38963, 38964), gave information on the dispersion of lead, zinc, and copper from the lode deposits, using analyses of stream and spring waters. This report describes a method of detecting the approximate position of an ore body by analysis of the overlying drift. Zinc and copper because of their dispersion habits were not satisfactorily located, unlike lead with limited dispersion and enriched in soils near the lode deposits. The total heavy metals content of residual soils was a good indicator of presence of vein faults and deposits, and was easy to determine. Near-surface glacial materials, muck, and peat along traverses across known vein faults were generally poor indicators of the presence of such vein faults or deposits. Samples of glacial material taken close to bedrock gave good anomalies, however. Topographic and geological conditions, character and composition of soils and glacial deposits are briefly outlined. The most satisfactory method of

511326—60——11

field sampling and the field laboratory procedure are described in some detail. Results of investigation generally indicate wide dispersion of zinc, slight dispersion of lead and erratic dispersion of copper; there is a possibility of detecting lodes and vein faults in this area by a grid of soil analyses. ***Copy seen:*** DGS.

49877. BOYLE, ROBERT WILLIAM, 1920– . Soil analysis as a method of geochemical prospecting for lead-silver deposits, in the Keno Hill area, Yukon. (Canadian mining journal, Jan. 1957, v. 78, no. 1, p. 49–55, 5 illus., incl. geol. map and cross-section, 3 tables.) 5 refs.

Contains results of geochemical research conducted by the Canadian Geological Survey in summer 1955 in the Keno Hill area (63°58′ N. 135°22′ W.). Dithizone (diphenylthiocarbazone) was used for estimating the content of heavy metals in the soils. Investigation of spring and stream waters (No. 38963) had given data on the dispersion of lead, zinc, and copper from lode deposits. Dispersion patterns, determined by character of soil, glacial deposits, vegetation, spring and stream water, as well as those of the lode and of surface topography, have a bearing on geochemical prospecting using soil analyses. Presence of permafrost does not affect applicability of this method. Zinc is the most strongly dispersed of the three elements; lead and copper have only a limited dispersion. Tabular summary of results of analyses of lodes, soils, and plants are presented. Recommendations to prospectors on procedures are added. ***Copy seen:*** DGS.

(*In:* Materialy po laboratornym issledovaniîâm merzlykh gruntov, sbornik 3, 1957. p. 117–28, tables) 21 refs. Text in Russian. ***Title tr.:*** Experimental study of moisture migration in freezing ground.

"The investigations are outlined, and the experimental procedure is described. The data obtained are tabulated and revisions of theories on forces active in moisture migration in freezing and frozen soils are proposed. Distilled water and $CaCl_2$ solutions were used to determine separately the migration intensity associated with tightly and loosely bound water in soil. The influence of many factors on moisture migration were observed, but maximum effects were associated with the adsorptive power of ice crystals and the mineral component of soils. The effects of ground freezing on the migration of film water will be investigated next."—SIPRE.

49894. BRANNIAN, J. D. Siting the DEW Line radar stations. (Engineering and contract record, July 1957. v. 70, no. 7, p. 53–55, +, illus.)

Contains a detailed description of the preparatory surveying work carried out before siting locations for the DEW Line field stations. Research started early in 1953 with priority on the Alaskan coastal area. From the main base established at Barter Island, light aircraft flew supplies to field stations. In the Canadian Arctic insufficient data were available to support the construction program. Air photographs, etc., were obtained from government and military sources and additional aerial surveying was carried out by the contractors in 1954. Transportation of materials and equipment was assigned to the Military Sea Transport Service, and temporary field stations were established in early 1955. Construction problems in permafrost areas are discussed, and aerial

photographing and surveying procedures are described and evaluated. The clothing problem is briefly mentioned, and the types of building foundations used, are listed. ***Copy seen:*** DLC.

Bd. 266, Heft 4, p. 357–72, illus. tables.) 37 refs. Text in German. *Other authors:* C. Albers *and* W. Usinger. ***Title tr.:*** The reactivity of circulation during hypothermia; a contribution to the problem of narcosis influence.

A study of circulatory reactivity and adaptation as dependent on depth of narcosis. Dogs made hypothermic to 20° C. were used. Even at 25–20° C., the various circulatory reflexes examined remained active. Depth of narcosis had a significant influence upon the absolute level of the circulatory values and upon their temperature course during hypothermia. The kind of death from cold also depended on depth of narcosis, shallow narcosis producing ventricular fibrillation, deep narcosis-asystole. ***Copy seen:*** DLC.

Results of measurements of vertical distribution of ozone and water vapor, made at Bardufoss (68° N. 18° E.) and at Tromsø (69°34′ N. 18°35′ E.), Apr.–July 1955, part of a general program to determine world-wide distribution of ozone. Meteorological equipment (listed) was installed in a Royal Norwegian Air Force Vampire trainer. First flights were failures, but four (June 24–July 12, 1955) successful flights gave results described and shown on graphs. All ascents showed a large increase in ozone concentration at the tropopause. Besides winter time ozone measurements, simultaneous temperature and humidity

measurements are recommended for additional knowledge of the tropopause.

Presents results of investigations 1951–55 by the U.S. Geological Survey, of Imikpuk Lake (approx. 71°20′ N. 156°40′ W.), North Alaska, typical of lakes in the coastal plain. Those in the Barrow area have average depth of 2–3 or 6–9 ft. The water is in an isothermal state during the ice-free period, late June–Sept. A two-cycle heating and cooling process takes place after the lake is frozen over; heat radiation through the ice is terminated when a thin cover of snow has accumulated; bottom sediments cause the second temperature rise, the magnitude of which depends on water depth and distance from the shore. Permafrost underlies the shallow lakes; an unfrozen basin of several hundred ft. depth may extend beneath the deeper ones. ***Copy seen:*** DLC.

Specimens were collected by the author and T. Scudder in the summer of 1952, during a Harvard Mountaineering Club expedition into the Alaska Range. ***Copy seen:*** DA.

49916. BRILL, RUDOLF FRIEDRICH, 1899– . Structure of ice. Wilmette, Ill., July 1957. iv, 67 p. illus., graphs, tables (U.S. Army. Corps of Engineers. Snow Ice and Permafrost Research Establishment. SIPRE report 33.) 42 refs.

"The procedures for growing samples of ice used in the experiments are described. Experiments using the method of bending bars of ice to determine their viscoelastic behavior were made. Tests were conducted on single crystals with various orientations, polycrystalline samples, and mixed crystals of ice-NH_4F. These tests showed that the hexagonal base plane is the gliding plane at plastic deformation and that Becker's equation can be used for the description of the viscoelastic creep of ice. Studies show that amounts up to 10% of NH_4F, may be absorbed in the ice lattice. Dielectric studies indicate that the relaxation time τ_0 decreases markedly with increasing concentration of NH_4F, down to a minimum value corresponding to some concentration between 0.1 and 1% NH_4F, and then increases again with further increasing concentration. The dc resistivity of ice-NH_4F increased with the concentration of NH_4F. Investigations were also carried out using X-ray diffraction techniques to determine the thermal amplitudes of H_2O molecules as well as of hydrogen atoms in ice. The molecular vibration can be described by a characteristic temperature of θ—220K."

49923. BRITTON, MAX EDWIN, 1912– . A tundra landscape. Washington, D.C., Office of Naval Research, 1958. 13 p. illus., maps. Reprinted from Research reviews, Jan. 1958.

Tundra as observed in the vicinity of Pt. Barrow, northern Alaska, has an overall uniformity, but variety in detail. Its landscape features: subdued relief, standing water, patterned ground, and vegetation cover of low-growing grasses and grass-like plants are described. Geomorphic processes causing develop-

ment and modification of polygonally patterned ground are explained, with discussion of the interrelationships between these processes and the plant populations. Photos of patterned ground and thaw lakes are included.

Journalist's sketches of the natural conditions, population, exploration and development in the region of the upper Lena, Vilyuy, Nizhnyaya Tunguska ("Ugryum-Reka"), Podkamennaya Tunguska (Katanga) and Angara Rivers, an area divided administratively between Irkutsk and Krasnoyarsk Provinces and Yakut A.S.S.R. Hunting, fur trade and reindeer breeding in the Tungus (Evenki) collective farms are described with notes on a hospital and its personnel, construction of a highway from Podvoloshino on the Nizhnyaya Tunguska across the watershed to Chekuysk on the Lena, etc. (p. 68–96). Construction of railroad between Ust'-Kut on the Lena and Bratsk on the Angara (p. 130–54); search for diamonds in the Nizhnyaya Tunguska and Vilyuy basins (p. 156–82) are reported. The leading role of M. M. Odintsov, the head of Tungusskaîa Expedition in 1947, in discovery of diamonds in Yakutia is stressed.

49942. BRONSON, E. H. Foundations for mill construction on clay and permafrost. (Mining engineering, Nov. 1957. v. 9, p. 1262–67, table, graphs.) 6 refs.

Construction methods and soil test procedures are described, from experience with structural problems of the Malartic Gold Fields Ltd. mining plant in Northern Quebec (approx. 48°10′ N. 78° W.) where ore-bearing country rock is covered by strata of clay, sand and silt to a depth varying to 40 ft. Soil investigations must be done prior to foundation design, and preliminary reconnaissance should be completed by the autumn preceding construction. Depth of the active layer is tested by rodding and auger boring. Permafrost islands of limited area consisting of silt or clay must be removed by stripping the overburden, melting with high-pressure steam, or blasting and scraping. Temporary buildings for light loads can be floated on the stabilized soil over continuous permafrost: the natural surface cover, undisturbed but increased by several ft. of sand or other insulation, topped with timber pads or mud sills, will carry the structure. Permanent buildings or heavy concentrated loads require piling or a concrete foundation. Wood piles are generally used because of their poor thermal conductivity. The piles are installed in holes produced by a high-pressure steam jet and allowed to freeze solid. Satisfactory pile depth is considered to be 1.5 times that of the active layer. The piles usually have an enlarged section at the bottom end, which is held rigidly in the refrozen permafrost and prevents any subsequent heaving. —From SIPRE. ***Copy seen:*** DLC.

Contains detailed explanation and computations, and summary, of one aspect of heating and cooling of the stratosphere. Stratosphere is believed to be the scene of large changes in temperature and circulation, but physical explanations for observed patterns remain inadequate. Two striking features of the arctic stratosphere the "monsoon" circulation observed bebetween 20 and 30 km., and the appearance of large perturbations on the strong zonal flow in winter, need fuller theoretical explanation; they are usually attributed to changes in radiational heating and cooling, produced in and just below the ozone layer by the seasonal movement of the sun. The stratosphere is assumed to be approximately in radiative equilibrium; but study of the sources of radiational heat gain and loss discloses need for examination of the radiation balance, with special reference to carbon dioxide. The arctic stratosphere below 30 km. is found in all seasons a region of net radiational deficit. Even in summer a deficit exists near the Pole. Carbon dioxide cooling contributes notably to the radiational rates of temperature change below about 40 to 60 mb.; it also determines the rates of change at all heights north of the boundary of polar night. In fall and winter the temperature change gradients are of a magnitude to favor maximum local temperature gradients at the polar night boundary above the 20 mb. level, a possible source for perturbations observed in this region.

49944. BROOKS, JOHN LANGDON, 1920- . The systematics of North American *Daphnia.* New Haven, Yale Univ. Press, 1957. 180 p. 65 illus., 61 plates incl. 6 maps, 7 tables. (Connecticut Academy of Arts & Sciences. Memoirs, v. 13.) 79 refs.

Contains a monographic treatment of the cladoceran subgenus *Daphnia,* with a general discussion of the systematic and zoogeographic findings, comparison with previous classifications, a key to North American species and descriptions of fifteen. The form and variation of each species is recorded in camera lucida drawings (over 300 in all). A synonymy, notes on taxonomic history, a differential diagnosis to supplement the key, and pertinent ecological and distributional data (six maps) are also given. At least five of the species occur in all sections of Alaska, northern Canada and the Aleutians; two species are recorded from Greenland. Ten regions are indicated into which North America can be divided on the basis of *Daphnia* systematics. A list of localities (except New England) and an index of names, are appended. ***Copy seen:*** DLC.

Reports results of a continuing study of such sea-ice properties as density, salinity, air-bubble distribution, size and distribution of crystal grains, elastic moduli. Observations were made at two sites in Bering Sea: 60°20′ N. 168°38′ W. in Feb. and Mar. 1954, and at 63°05′ N. 166°09′ W. in Mar. and Apr., 1955, from or near USCGC *Northwind*. The results, it is stressed, are "point" data, from a given point in a relatively short time; equipment layout is shown on diagram. Recommendations for further study include the variation of all parameters over one entire ice season at one location, and continuous measurements over a complete ice season of four parameters.

"Ice movement and governing factors are examined in detail on the basis of observations at T–3, May 1952–Sept. 1955, and theoretical considerations. The pattern of movement is clockwise and much of the ice pack north of Greenland, Canada, and Alaska may be caught in a closed orbit. Near the North Pole the movement is either toward the Atlantic or back into another orbit. The time required for a complete movement of ice across the ocean north of Siberia from the Laptev Sea to the Greenland Straits appears to take about three yrs., while that for a complete cycle of Alaska and Canada can vary from 4–10 yrs., depending on the orbit. The causes for ice movements are atmospheric circulation, which acts by virtue of the wind stresses on the rough ice surface, and ocean circulation beneath the ice. The movement of T–3 in the higher latitudes is greater in proportion to winds than that nearer the coast of Ellesmere Island, which may be due to the effect of the movement of the ice island itself in the region of more loosely packed ice. The general scattering of T–3 data can be traced to convergence and divergence of wind systems and resulting accumulation of pressures, which are transmitted through the ice to affect local conditions."—SIPRE.

Recent climatic classifications have their origins in dynamic climatology.

511326—60——12

The major causative factor of the climatic differentiation of the Northern Hemisphere is claimed to be air masses. Their type and characteristics are determined at 60 stations (including northern Canada, Alaska, Greenland, Svalbard, U.S.S.R.) from a five-year series of weather maps. By this method (termed "aerosomatic") air mass regions are delimited for alternate months. Frequency of each air mass also mean and extreme values of major meteorological elements observed in conjunction are diagrammed for six type-stations (including Matochkin Shar, Novaya Zemlya, 73°16′ N. 56°27′ E.). With Europe as example (including northernmost parts), a short description of each "aerosomatic" province is given according to the occurrence, sequence and effectiveness of individual air masses.

49985. BUGGE, JENS A. W. Rana gruber; geologisk beskrivelse av jernmalmfeltene i Dunderlandsdalen. Oslo, Aschehoug, 1948. 149 p., illus., plates, maps, incl. 3 fold., diagrs. (Norway. Geologiske undersøkelse. Skrifter, nr. 171.) Text in Norwegian. Summary in English. ***Title tr.:*** Rana mines; geologic

description of the iron ore deposits in Dunderland valley.

The surface and bedrock geology of the several small ore bodies in a small section of Dunderlandsdalen in northern Norway were surveyed and investigated by diamond drilling. Tectonics, petrology, and chemical and spectral analyses of the ores are described and variation diagrams included. These upper Cambrian or lower Ordovician sedimentary magnetite and hematite ores and the related dolomite and calcite marbles and lime-rich schists are believed to have been deposited in a shallow marine area between two continental areas under conditions of strong chemical weathering and an atmosphere rich in CO_2. Comparisons are made with ore deposits and bedrock geology of other localities in northern Norway and Sweden. ***Copy seen:*** DGS.

49991. BULL, COLIN B. B. A gravity survey of a glacier-dammed lake in North Greenland. (Royal Society of Edinburgh. Proceedings, 1957–1958. v. 67, pt. 1, Sect. B, Biology, p. 42–53, 3 text maps, diagr.) 5 refs. Communicated by R. A. Hamilton.

Contains results of survey of frozen Britannia Sø during first winter of British North Greenland Expedition. Survey was made Dec. 1952–Mar. 1953 to test reliability of the gravity meter and readings were obtained at about 230 points on the western half of the lake. Results suggested their use in estimating lake depths as part of the study of the glacial geomorphology of the area, and, by calculations, a contour map of the lake bottom, contour interval 25 m., was produced. A map is presented showing the combined effect of the latitude effect and the variations of the topographically corrected Bouguer anomaly, it has a 2-milligal interval. The geomorphological significance of a submerged shelf found along the western side of the lake, and of the shape of the lake bottom, is discussed briefly. ***Copy seen:*** DGS.

49992. BULL, COLIN B. B. Observations in North Greenland relating to theories of the properties of ice. (Journal of glaciology, Mar. 1957. v. 3, no. 21, p. 67–72, graph, 2 tables.) 15 refs.

Inland ice thickness was determined and traverse made from Dronning Louises Land (77°30′ N. 25° W.) to Nunatarssuaq (76°30′ N. 68° W.) to measure gravity values and determine altitude of stations, during the British North Greenland Expedition, 1952–1954. Surface slope of the ice was measured directly to test Nye's formula relating slope and thickness (No. 31650). Values and azimuths of maximum slopes are given for 14 stations (complete values, No. 41788); calculated and measured ice thickness and shear stress are stated. Variations of shear stress may not be related to rates of movement. Different values of shear stress in north and south Greenland may be due partly to presence of bottom melting in the north. Temperatures in the ice sheet are discussed.

(Canada. Meteorological Branch. Circular 2939, TEC–252.) 11 refs. Mimeo. *Also pub as:* Royal Meteorological Society, Canadian Branch, Papers, 1957. v. 8, no. 1, p. 16–39.

Ice formation and melting of Canadian rivers and lakes are discussed on the basis of records from 360 stations (about

a dozen in the far North) covering periods from 36–40 years, and the meteorological conditions prior to initial ice formation and breakup are examined to determine the critical number of days of freezing and thawing required to produce these changes. Average freeze- and break-up dates for Canada are mapped; in the North, time of average breakup varies from Aug. 1 in the Arctic Islands to May 15 in the Great Slave Lake area; freezeup occurs about Sept. 1 in the northwestern Arctic Islands, and about Nov. 1 in central Labrador; the interval between breakup and freezeup ranges from one to five months. Average dates of opening and closing of navigation in the Mackenzie River are tabulated; and data are graphed on mean daily air temperatures from Mar. 1 to the date of breakup, and from Oct. 1 to the date of skim-ice formation in the North Saskatchewan River, as well as similar data on freezeup of the Athabaska River.

Text in Russian. ***Title tr.:*** Achievements of the Soviet geographic explorations in the Arctic. Translated by E. R. Hope for Canadian Defence Research Board July 1957, *its* T253 R, 26 p. (copy at CaMAI).

Condensed but encyclopedic account of Russian arctic explorations from the Great Northern Expedition of the early 18th century to the present-day High Latitude Expeditions and drifting stations North Pole-3–6 with summary of their work in the physical sciences. Notes on the main expeditions include dates, names of leaders and outstanding members, area of investigation, and achievements. Fourteen hydrological expeditions sent out by the Arctic Institute U.S.S.R. in the last five years, have covered 68,972 sea miles in study and survey of arctic waters. Ice reconnaissance in summer and winter has logged over 500,000 air km. annually. In 1954, Soviet aircraft covered more than a million km. over the Arctic Basin, made several hundred landings (none forced) on drifting ice, and delivered 15 carloads of freight to the drifting stations; these records were surpassed in 1955 and 1956. In 1955,

an expedition on the ice-breaker *Litke* rounding Franz Joseph Land and Spitsbergen, reached 83°11′ N., a record latitude for a free-sailing ship. New methods and observation techniques have been worked out by Soviet explorers, and many new instruments and devices constructed by the Arctic Institute, among them a heavy hydrographic winch "North Pole," a radiosonde field laboratory, a thermometric installation, a magnetic variation station, automatic radio-beacon "Vekha," a flying observatory, Flinders bar, current integrator, self-recording current meter (direction and velocity), automatic meteorological transmitter, magnetometer with visible recording, automatic field ionosphere self-recorder, a radiowave tester, Shaposhnikov's movable prefabricated house type 4 (PDSh–4, Podvizhnoĭ domik Shaposhnikova, tip 4). The main publications relating to the Arctic are stated to include monographic descriptions of the Chukotsk National District, Henrietta Island, Kotel'nyy Island and Novaya Zemlya, G. I͡A. Vangengeĭm's *Osnovy makrot͡sirkuli͡atsionnogo metoda dolgosrochnykh prognozov pogody dli͡a Arktiki* (Principles of the macro-circulation method of long-range weather forecasting for the Arctic), A. P. Nikol'skiĭ's *Magnitnye vozmushcheni͡a v Arktike* (Magnetic disturbances in the Arctic) and a part of the scientific results of Drifting Station "North Pole-3" and "North Pole-4." Maps show aircraft landings on the Arctic Basin ice during 1937–56, including those outside the so-called Soviet sector, a scheme of ice drifts and (p. 35) drifts of Soviet stations. ***Copy seen:*** DLC.

50013. BURKHANOV, VASILIĬ FEDOTOVICH. Velikiĭ Severnyĭ morskoĭ put'. Priroda, Jan. 1958. god 47, p. 9–18, illus. map). Text in Russian. ***Title tr.:*** The Great Northern Sea Route.

Significance of this Route to life and economy of arctic U.S.S.R. is discussed; Russian penetrations and expeditions are outlined from the 18th century to the present including explorations by air, advances following the Revolution, establishment and administration of the Route. Investigation of the polar region, weather and ice studies and forecasts, oceanographic work, publications, conditions during World War II, shipbuilding, are reviewed. ***Copy seen:*** DLC.

A study of heat losses from the head made by measurements with a temperature gradient calorimeter. It was found that at rest and 40° F., the head gives off one half of the body's heat production, at 5° F. three-quarters of it. Recommendation is made that except for periods of work and exercise in the cold, headgear should be always worn.

Contains a general account of four voyages of this naval officer and prominent explorer. The first was made in 1821 with two vessels, the brig *Golovnin* commanded by Khromchenko and cutter *Baranov* (A. K. Étolin), from Novo-Arkhangel'sk on Baranoff Island to Kodiak Island, Unalaska, the Pribilof group, Golovnin Bay and back. Khromchenko repeated the trip in 1822 from Baranoff to Stuart Island. The coast of Alaska and islands visited were described and mapped. A dictionary of native languages was compiled and a diary kept of the expedition. Later Khromchenko made two circumnavigations, in 1828 on the *Elena,* and in 1831–33 on the transport *Amerika,* from Kronshtadt to Novo-Arkhangel'sk. On both these voyages he explored the islands of Pacific Ocean and the coast of Alaska; during his voyage in 1831–33 he visited also Kamchatka Peninsula (Petropavlovsk).

Technical Report EP–59, May 1957. *Other authors:* P. F. Iampietro and B. E. Welch.

A study of basal and resting oxygen consumption (VO_2) in eight groups of men, to determine the effects of specific dynamic action, of exercise and climate upon metabolism. Two groups lived at Fort Churchill Canada, and at Mt. Washington, N.H. Climate (temperature) as such did not appear to affect basal VO_2 or the pattern of resting metabolism, with exception that at 20.00 hours, the VO_2 in hot-day environment was higher than in the moderate or cold at the same time. Peak VO_2 associated with specific dynamic action amounted up to two times basal VO_2, indicating the necessity of considering food intake and time after meal, when total VO_2 is determined. ***Copy seen:*** DNLM.

Text in Russian. ***Title tr.:*** Petrology of the ultrabasic and alkali rock complex of the Maymecha-Kotuy River basin.

Presents results of author's field investigation, 1952–1955, in the Maymecha-Kotuy interfluve region, 71°45′ N. 102° E., and his study of petrographic collections made earlier by others. Magmatic activities in the region are outlined. The magmatic series of melanocratic nepheline basalt, limburgite, ankaratrite, and augite, and the appearance of these minerals in vein facies are described. The maymechite mineral-bearing series discovered by IU. M. Sheĭnmann and P. S. Fomin in 1943–44 is outlined. The chemical properties of the magmatic rocks are discussed and results of analyses are tabulated and diagrammed. The dunite-peridotite-bearing intrusion of the Sabyda-Gulya River area and its vein facies are treated; the tectonics, especially of magmatic intrusions, are reviewed.

50035. BYERS, FRANK MILTON, 1916– . Tungsten deposits in the Fairbanks district, Alaska. (*In:* U.S. Geological Survey. Mineral Resources of Alaska, 1954–55. *Its:* Bulletin, 1957. no. 1024–I, p. 179–216, 7 maps, incl. 6 fold., 6 tables.) 10 refs.

Describes three deposits of scheelite, 10–20 miles northeast of Fairbanks. Location, accessibility, topography, etc., are noted, geologic features of the district described, and the tungsten deposits treated in detail. Analysis of 88 samples from one lode showed an average of 6.1% tungsten trioxide (WO_3); other lodes in the area contain less WO_3. During 1942–1944, 60 tons of ore produced 273 units, and 38 tons of concentrates and middlings produced 1923 units of WO_3. No mining is being carried on now. Scheelite-bearing lodes, as yet undiscovered in the Fairbanks district, are also considered; favorable factors are noted, and two areas are recommended for study. ***Copy seen:*** DGS.

50042. BYRNE, J. C. Rayrock in production. (Western miner and oil review, July 1957. v. 30, no. 7, p. 60.)

Reports surface and underground development, construction, production potential, and financial status of Rayrock Mines Ltd., uranium mine and mill located about 35 mi. from Marian Lake, Mackenzie District. Milling started May 31, 1957; overall recovery of 94% is expected. ***Copy seen:*** DI.

50043. BYRNE, NORMAN W. The Rayrock story. (Western miner and oil review, Apr. 1957. v. 30, no. 4, p. 71–77, illus., maps.)

Describes the geology, exploration, plant construction, milling process, mining costs, and freighting methods of the Rayrock Mines Ltd. Its property is on Sherman Lake (62°27′ N. 116°31′ W.) in the Marian River area of Mackenzie District. Uranium occurrences were first discovered in 1948; production is to begin in June. Living facilities, and some personnel are indicated.

50044. CAHN, J., *and* **M. HÉROLD.** Métabolisme cardiaque sous hypothermie. (Société de Biologie, Paris. Comptes rendus, 1956. t. 150, no. 10, p. 1689–93, tables.) 3 refs. Text in French. ***Title tr.:*** Cardiac metabolism during hypothermia.

Account of investigations on dogs made hypothermic with pharmaca ("artificial hibernation") or by external cooling. Changes were studied and compared in both groups and in normothermic animals in regard to hemodynamics, glucose, lactate and pyruvate utilization. Mild hypothermia only (down to 27° C.) was applied. ***Copy seen:*** DNLM.

50045. CAHN, J., *and* **M. HÉROLD.** Métabolisme cardiaque sous hypothermie; effets de l'hormone somatotrope, STH. (Société de Biologie, Paris. Comptes rendus, 1956. t. 150, no. 11, p. 1879–81, table) 4 refs. Text in French. ***Title tr.:*** Cardiac metabolism during hypothermia; effects of the somatotropic hormone, STH.

Account of experiments on dogs, with normothermic animals as controls. At 26° body temperature, STH reduced cardiac utilization of glucose and pyruvate, and raised that of lactate. Animals given lytic cocktail showed at 28° C. a higher utilization of glucose than at normal body temperature, with pyruvate utilization slightly and that of lactate considerably reduced.

50046. CAHN, J., *and* **M. HÉROLD.** Métabolisme cardiaque sous hypothermie, 3; effets du rythme idioventriculaire et de l'arrêt total de la circulation veineuse de retour. (Société de Biologie, Paris. Comptes rendus, 1956. t. 150, no. 11, p. 1932–34, table) 4 refs. Text in French. ***Title tr.:*** Cardiac metabolism during hypothermia, 3; effects of idioventricular rhythm and of total arrest of venous return circulation.

In the "hibernating" dog (29° to 27° C.) total arrest of venous return circulation caused a reduction of the coronary debit. Xylocaine infiltration into the sinus node evoked the appearance of idioventricular rhythm and of bradycardia accompanied by a reduction of coronary debit; complete arrest of circulation also caused a fall in coronary deficiency. The metabolic effects of these conditions are also discussed.

511326—60——13

Account of studies conducted in 1955 from HMCS *Labrador*. Of the two main theories on discoloration of this ice: air-borne deposition of dirt and suspension-freezing of sediments, the latter is considered as "more complete and answering the arguments that the wind theory fails to take into account." Mineralogically the ice and bottom sediments show common origin; however, the Foraminifera found in the ice samples were benthonic forms. A list of these Foraminifera is appended.

50058. CAMPBELL, WILLIAM J. The arctic jet stream. Seattle, Wash., July 1958. 41 p. 2 tables, 8 graphs. (Washington, *State*. University, Dept. of Meteorology and Climatology. Arctic meteorology—climatology, occasional report no. 10. Scientific report no. 1, AF contract 19 (604)-3063) 15 refs. Sponsored by the Geophysics Research Directorate of the U.S. Air Force Cambridge Research Center, Air Research and Development Command.

A model of the arctic jet stream is constructed, using a new method for averaging temperature and wind fields. Characteristic temperature and wind distribution from the surface to about 13 km. and from 61°N. to 81°N., is shown on graphs. Jet streams ordinarily are not single entities, ordered and regular in movement, but multiple, splitting and coalescing and meandering over wide areas. They are closely related to the frontal zones and probably occur as often in the Arctic as in temperate latitudes. ***Copy seen:*** DWB.

Copy seen: DGS.

50060. CANADA. BUREAU OF STATISTICS. Monthly review of Canadian fisheries statistics, Ottawa, 1, 1947– *in progress*.

Contains statistical data on landings, by provinces and species of sea fish, including such from arctic waters of the northwest Atlantic, their quantity and value, disposition, etc. Similar information is given on fresh-water fish from Northwest Territories, Quebec and Ontario. Subsequent sections present data on processing, including by-products (meal, oil, skins, etc.); stocks of sea and fresh-water fish, frozen, salted and otherwise preserved; imports; exports; prices; as received by fishermen; wholesale, retail, price indexes. The detailed statistics are preceded by a summary review for the month. ***File seen:*** DLC.

50061. CANADA. DEFENCE RESEARCH BOARD. Operation Hazen; narrative and preliminary reports for the 1957 season. Ottawa, Jan. 1958. 3, 57 p. illus., 3 maps incl. 2 fold., diagr. (*Its:* Operation Hazen no. 2.)

Describes work of a nine-man expedition, the first to the Lake Hazen area of northern Ellesmere I. since 1935 (No. 11700), part of the Canadian IGY program. Led by glaciologist G. F. Hattersley-Smith, expedition carried out field investigations in meteorology, glaciology, geology, geophysics, wildlife, and on equipment and food, May 2–Aug. 18. Base camp on north shore of Lake Hazen, and Gilman Glacier camp, at approx. 3400 ft. elev. 25 mi. northeast of the base, were starting points for several trips by boat, aircraft, dog team, tractor, and on foot. An introductory review of work in the area, by G. F. Hattersley-Smith (p. 1–2), is followed by topical reports:

Lake Hazen base camp: chronology, by R. E. Deane (p. 3–4);

Gilman Glacier camp: narrative, by G. F. Hattersley-Smith (p. 5–8) of activities of glacier camp party;

Sealift, by J. P. Croal (p. 9–12), transportation of personnel, equipment and supplies to Thule and thence to Lake Hazen, by icebreaker, plane, and helicopter;

Hydrographic information, by J. P. Croal (p. 13–15, fold. map), soundings and other hydrographic data on Conybeare Bay and Chandler Fiord;

Bedrock geology, by R. L. Christie (p. 16–18), reconnaissance survey May 15–Aug. 15;

Pleistocene geology and limnology, by R. E. Deane (p. 19–23, fold. map), glacial deposits, notes on streams and Lake Hazen;

Geophysics, by F. S. Grant (p. 24–25), six profiles of bedrock topography under Gilman Glacier;

Glaciology, by G. F. Hattersley-Smith (p. 26–31), regime of the highland ice;

Meteorology, by J. R. Lotz (p. 32–37), summary of observations May 14–Aug. 8: temperature, relative humidity, wind, pressure, clouds and cloudiness, fog, sunshine, precipitation accumulation and ablation on Gilman.

Survey, by K. C. Arnold (p. 38–40), determination of positions and elevations of seismic and gravity observation points, movement of Gilman Glacier;

Wildlife, by R. L. Christie and G. F. Hattersley-Smith (p. 41–44), numbers of mammals, birds, etc., observed at each camp site, with notes.

Meteorological equipment, by J. R. Lotz (p. 45–52, diagr.), list of instruments, performance, disposition;

Selected items of army clothing and equipment by G. F. Hattersley-Smith (p. 53–55), use and performance.

Selected items of food, by G. F. Hattersley-Smith (p. 56–57) use, palatability, performance. ***Copy seen:*** CaMAI.

50062. CANADA. DEPT. OF EXTERNAL AFFAIRS. North Pacific fur seals convention. (*Its:* External affairs, May 1957. v. 9, no. 5, p. 176–78, illus.)

Notes success of the North Pacific Fur Seal Conference, held in Washington, Nov. 1955–Feb. 1957. An Interim Convention signed by Canada, Japan, U.S.S.R. and the United States (replacing the North Pacific Fur Seal Convention of 1911–1941 and the bilateral Canadian-American agreement since 1942) provides for a co-ordinated six yr. research program to determine herd management and the seals' damage to commercial fishing. During this period, pelagic sealing is restricted to controlled annual kills made on island breeding grounds by United States and U.S.S.R., with shares based on a 15% formula to Canada and Japan. Activities are to be co-ordinated by a Joint Commission which will make recommendations, based on the research data, for a permanent convention. Fur seal population is approx. 1,800,000 on the Pribilofs and 100,000 on Komandorskiye and Tyuleniy Islands. ***Copy seen:*** DLC.

50063. CANADA. DEPT. OF FISHERIES. Accomplishments of I.N.P.F.C. (*Its:* Trade news, May 1958. v. 10, no. 11, p. 7–8, 10, illus.)

Information is presented on the size of the area covered by the International North Pacific Fisheries Convention; intermingling of North American and Asian salmon populations; oceanographic conditions and salmon movements and distribution; British Columbia salmon caught in the sea; etc. ***Copy seen:*** DLC.

50064. CANADA. DEPT. OF FISHERIES. Atlantic seal fishery. (*Its:* Trade news, Feb. 1957. v. 9, no. 8, p. 18.)

Contains information on the number of Canadian, Newfoundland and Norwegian vessels participating in the 1957 sealing, comparisons with 1956, yields; whaling prospects generally. ***Copy seen:*** DI.

50065. CANADA. DEPT. OF FISHERIES. Fur seal investigation. (*Its:* Trade news, Feb. 1958. v. 10, no. 8, p. 19–20.)

Information on the first Canadian research group on North Pacific fur seal and their immediate activity; the North Pacific Fur Seal Convention and its provisions; distinction between hair seal and fur seal. ***Copy seen:*** DI.

50066. CANADA. DEPT. OF MINES AND TECHNICAL SURVEYS. Annual report for the fiscal year 1956–57. Ottawa. Queen's Printer, 1957. 133 p. illus., tables.

Contains reports of the Surveys and Mapping Branch, Geological Survey, Mines Branch, Dominion Observatories and Geographical Branch, each including work in the Arctic and sub-Arctic. During 1956, the Geodetic Survey, using shoran, extended framework of survey control northward to the 75th parallel, and plans to complete the network over the Arctic Islands in 1957. The Topographical Survey completed control for the 1:250,000 mapping of Yukon, started in 1944. The CGS. *Baffin*, designed for arctic work, was added to the Hydrographic Service fleet. Twelve aeronautical charts of areas in Ellesmere Island and the Sverdrup Islands were being sketched. New maps (1066) printed by the department, included many of arctic areas. Five geological field parties were in the Northwest Territories and Yukon, and others in northern Quebec. Dominion Observatories carried on extensive magnetic studies in preparation for the IGY. The Geographical Branch field surveys in the Northwest Territories, and study

on sea-ice conditions in Hudson Bay and Strait are noted. ***Copy seen:*** DGS.

50067. CANADA. DEPT. OF MINES AND TECHNICAL SURVEYS. Minerals, Canada and the world. Ottawa, 1957. 2 pt.: 247, 114 p., illus. (*Its:* Mineral Resources Division. Mines Branch Report no. 860.)

Relates Canada's mineral industry to the world's by means of proportional circle maps, bar charts and line graphs of production and trade of 35 metals, nonmetals and mineral fuels. Maps show locations of producing areas, areas being developed for production, major known occurrences not currently under development, smelters and refineries. Present and future development in Canada is noted for each of the 35 minerals. Statistical data from which the maps, graphs and charts were prepared are tabulated in supplement (114 p.) without areal breakdown. ***Copy seen:*** DGS.

CANADA. DEPT. OF MINES AND TECHNICAL SURVEYS, *see also Canadian weekly bulletin.* News notes. *1958.* No. 50123.

50068. CANADA. DEPT. OF MINES AND TECHNICAL SURVEYS. GEOGRAPHICAL BRANCH. Atlas of Canada. Ottawa, 1958. 1 v.: 450 maps on 110 sheets, 20 x 27½ in. Basic projection: Lambert conformal conic, standard parallels 49° N. and 77° N.

Basic work: cartographic compendium of the geography of the country, including exploration (1), map coverage (4, 5, 8), bathymetry and physiography (9–13), geology (15–17), seismology, magnetism and tides (18) meteorology (19–32), hydrology (33–34), soils (35), insects (37), vegetation (38–41), fauna (42–45), population (46–55), furs, whaling and fish (58), industry and mineral resources (61–76), electric power (77–78), transportation (82–88), trade, finance and construction (89), shipping (90), communications, hospitals and education (91–93), populated places, census and electoral district (95–108), political evolution (109); also Canada and the world, polar projection (110). Scales of maps showing arctic areas are chiefly 1:5,000,000, 1:10,000,000, 1:20,000,000; a few are 1:30,000,000, or 1:50,000,000. Most maps are in color. ***Copy seen:*** DLC.

50069. CANADA. DEPT. OF MINES AND TECHNICAL SURVEYS. GEOGRAPHICAL BRANCH. Canadian maps 1955–1956. Ottawa, 1958. 40 p. (*Its:* Bibliographical series no. 21.) In sequence to No. 44254.

Lists selected maps of Canada, the provinces and territories; part 2 is a comprehensive list of map sheets in federal topographical series published or revised in 1955–1956. Map sheets at scale 1:50,000, 1:250,000, 1:506,880 for parts of the Yukon, Northwest Territories, northern parts of Manitoba, Ontario, Quebec are included. Detailed geologic maps, aeronautical charts and certain special maps are not included; but aeromagnetic maps (at scale 1:63,360) and hydrographic charts are listed.

Basic reference work: annual summary and review of metals and minerals produced on a commercial scale in Canada during calendar year. Latest volume (1955, pub. 1959) contains reviews for 25 metallics, 35 industrial minerals, and five mineral fuels; outstanding events and accomplishments in 1955 are noted, including (in the North) new nickel production from the Lynn Lake mine of Sherritt Gordon Mines Ltd., large-scale operations of the Iron Ore Company of Canada in Quebec-Labrador, uranium production in the Beaverlodge area of northern Saskatchewan and at Port Radium on Great Bear Lake, etc. During 1955, the industry achieved the largest annual advances in volume and value of output ever recorded, although Yukon and Northwest Territories showed small decreases compared with 1954.

50076. CANADA. DEPT. OF NATIONAL HEALTH AND WELFARE. Tuberculosis services in Canada. Ottawa Research Division, Dept. of National Health and Welfare, 1955. 65 p., graphs, tables (*Its:* General series, memorandum no. 11.)

A report covering Federal tuberculosis services, activities of voluntary agencies, provincial, specially control, programs and their costs. Federal services among Indians and Eskimos (p. 4–7) include case finding and diagnostic service; hospitals and hospitalization; itinerant, floating and flying services, etc.

Copy seen: DLC

50077. CANADA. DEPT. OF NORTHERN AFFAIRS AND NATIONAL RESOURCES. Annual report, fiscal year 1957–1958. Ottawa, Queen's Printer, 1958. 122 p., illus., tables, fold. map. 9 appendices.

Fifth, similar in content to previous (cf. No. 39129) reports. Activities in the far North reported include highway and bridge construction, community building for Eskimos and Indians, mining exploration, study and development of water and water power resources, field work in natural and social sciences, etc. The department was represented at the International Conference on the Law of the Sea in Geneva, Feb.–Apr. 1958, and

obtained an agreement on rights to the Continental Shelf. Appendices B, G–I present statistics from the Northern Administration and Lands Branch; 1957–1958 publications of the Dept., several dealing with the Arctic; annual reports of the Commissioner of the Northwest Territories and of Yukon, including information in legislation, public works, health, education, welfare, conservation, finances, etc. ***Copy seen:*** DGS.

50078. CANADA. DEPT. OF NORTHERN AFFAIRS AND NATIONAL RESOURCES. WATER RESOURCES BRANCH. Water powers of Canada. Ottawa, Queen's Printer, 1958. 76 p., illus., 4 diagrs., 10 maps, incl. 1 fold., tables. Map legends in English and French.

Eight principal river basins are described, noting their suitability for power development; included are the Yukon, Mackenzie, Nelson, and Hamilton. Available and developed water power resources are reviewed (Yukon Territory has 23,190, and Northwest Territories 13,050 hp. developed); increasing use of hydro-electric power and its effect on industry is reported; principal hydro-electric and hydraulic developments with turbine capacities Dec. 31, 1957, are tabulated, including four in Yukon and Northwest Territories.

Copy seen: DGS.

50079. CANADA. DEPT. OF NORTHERN AFFAIRS AND NATIONAL RESOURCES. WATER RESOURCES DIVISION. Surface water supply of Canada. Arctic and western Hudson Bay drainage, and Mississippi drainage in Canada, climatic years 1953–54 and 1954–55. Ottawa, Queen's Printer, 1958. 613 p. text map, tables. (*Its:* Water resources paper, no. 117.)

Includes hydrometric data for Mackenzie River at Simpson and Norman Wells, Slave River at Bell Rock, Great Slave Lake basin, Liard River basin, Great Bear Lake basin, Nelson and Churchill River basins. Data include monthly and daily discharge, monthly summaries of lake levels, inflow and outflow, for years ended Sept. 30, 1954 and 1955. Earlier reports on these river basins are listed as No. 21104, 33873. ***Copy seen:*** DGS.

50080. CANADA. DEPT. OF NORTHERN AFFAIRS AND NATIONAL RESOURCES. WATER RESOURCES DIVISION. Surface water supply of Canada. Pacific drainage, British Columbia and Yukon Territory, climatic years 1952–53 and 1953–54. Ottawa, Queen's Printer, 1957. 454 p. text map, tables (*Its*: Water resources paper, no. 118.)

Includes (p. 55–87) discharge data for the Aishihik River near Whitehorse; for the Dezadeash at Haines Junction; the Yukon at Whitehorse, Hootalinqua, Carmacks, and Dawson; Atlin Lake at Atlin; Takhini River near Whitehorse; Teslin Lake and River near Teslin; Big Salmon River near Carmacks; the Pelly at two points; Kluane Lake and River near Burwash Landing; and Stewart River near Mayo, all in Yukon Territory. Data for most streams include monthly and daily discharge for climatic years ending Sept. 30, 1953 and 1954; data for lakes include daily elevations in ft. for same period. For previous reports, see No. 39131. ***Copy seen:*** DGS.

50081. CANADA. DEPT. OF TRANSPORT. Aerial ice survey, Hudson Bay and Strait, 1958. Ottawa, June 10, 1958 7 p., mimeo.

Contains plans and directives for survey, July 14–Aug. 31, 1958, of recognized shipping track from port of Churchill to Resolution Island, covering the north and south side of Hudson Strait, west coast of Ungava Bay as far as Gyrfalcon Islands (approx. 59° N. 69° W.), and Frobisher Bay. Five schedules show: proposed flights of chartered plane from base at Churchill; general directive; communications; radio broadcasts of ice conditions; distribution of reports from Ottawa.

Copy seen: DN–HO.

50082. CANADA. DEPT. OF TRANSPORT. Navigation conditions on the Hudson Bay Route from the Atlantic Seaboard to the port of Churchill. Season of navigation 1956. Ottawa, Queen's Printer, 1957. 138 p. text maps, illus., tables, diagrs. (*Its:* Annual report, no. 28.)

Contains brief notes on navigation aids, shipping, reports from masters, and an aerial survey made in 1956; an historical account of Hudson Bay shipping by N. L. Nicholson; hydrographic information; tables of radio coast and direction-finding stations, and lights; reports from vessels using the route; glossary of ice navigation terms; radar reports and an analysis of ice conditions by A. D. Head. Weather reports from seven shore stations and four ships for all or part of period

July 1–Oct. 31, 1956, are tabulated and summarized. ***Copy seen:*** DN–HO.

50083. CANADA. DEPT. OF TRANSPORT. Navigation conditions on the Hudson Bay Route from the Atlantic Seaboard to the port of Churchill. Season of navigation, 1957. Ottawa, Queen's Printer, 1958. 132 p. text maps, illus., tables, diagrs. (*Its:* Annual report, no. 29.)

Contents similar to those of No. 50082. Summary stresses the thirty-mile ice belt extending northeast from Cape Hopes Advance, and the large quantity of drift ice on the steamer track in Hudson Bay. Fifth and final analysis of radar ice reports by A. D. Hood, notes value and limitations of radar for navigation in Hudson Bay; during the five-year survey, general area of dangerous navigation has been well defined. Most meteorological stations reported above-normal temperatures generally, Feb. through Oct. Precipitation varied from none to twice normal.

CANADA. DEPT. OF TRANSPORT, *see also: Canadian weekly bulletin.* News notes. *1958.* No. 50123.

50084. CANADA. FISHERIES RESEARCH BOARD. Annual report 1956–1957, for the fiscal year ending March 31, 1957. Ottawa, Queen's Printer, 1957. 195 p., illus., tables.

Contains reports covering the period Jan. 1, 1956–Mar. 31, 1957. Of arctic interest are primarily the sections on the Arctic Unit, Montreal (p. 111–14) and on oceanography (p. 115–25). The first covers fisheries investigations of the Mackenzie delta, the Pelly and Garry Lakes and Back River, Northwest Territories; investigations of marine mammals, plankton, hydrography, etc. The second deals with fisheries oceanography, including surveys of the Beaufort Sea, Hudson Bay and Strait, Foxe Basin and Channel, and other arctic waters. Sea ice research, primarily as related to shipping, and Canadian cooperation in the IGY are also reported. ***Copy seen:*** DI.

CANADA. FISHERIES RESEARCH BOARD, *see also* Bishop, Y., *and others.* Index . . . publications . . . Fisheries Research Board of Canada, 1901–1954. *1957.* No. 49742.

50085. CANADA. FISHERIES RESEARCH BOARD. ATLANTIC OCEANOGRAPHIC GROUP. Oceanographic stations, arctic areas only, occupied by H.M.C.S. "Labrador" 1954 to 1957. Ottawa, 1958. Fold. map, scale 1 in.=approx. 75 mi. Produced and printed by the Surveys and Mapping Branch for the Defence Research Board of Canada.

Shows location of 701 oceanographic stations in the area from Baffin Bay-Davis Strait westward to Beaufort Sea, including Hudson Strait. Legend gives pertinent data: number of bathythermographs; salinity, oxygen, phosphate and silicate, and bottom samples obtained; plankton hauls, etc. ***Copy seen:*** DN–HO.

50086. CANADA. GEOLOGICAL SURVEY. Aeromagnetic maps published 1947–1955. Ottawa, 1956. 28 p., fold. map. Mimeo. (*Its:* Geophysics paper no. 304).

Lists by province or territory, maps published by the Survey during this eight-year period; includes 40 in the Northwest Territories.

Copy seen: DGS.

50087. CANADA. GEOLOGICAL SURVEY. Geology and economic minerals of Canada. Ottawa, Queen's Printer, 1957. xiii, 517 p. illus., plates, maps, incl. 4 fold. in pocket, diagrs., tables, incl. 7 fold. in pocket. (*Its:* Economic geology series no. 1, 4th edition, C. H. Stockwell, editor.) Refs. Third edition, 1947, was listed as No. 2781.

Basic source of information on the geology and the mineral industry. Recent developments noted include: rise of petroleum to first place in value of output in 1953; iron ore production in Labrador and Quebec; uranium production extended from one (Eldorado) to nine mines; activities in base metals, etc. Following a general introduction by C. S. Lord, each of the major physiographic regions is described in turn, viz,: the Canadian shield mainland by J. M. Harrison; the Appalachian region by L. J. Weeks; the St. Lawrence and Hudson Bay Lowlands and Palaeozoic outliers by J. F. Caley and B. A. Liberty; the Interior plains by R. T. D. Wickenden; the Cordilleran region, by H. S. Bostock, R. Mulligan and R. J. Douglas; and the Arctic Archipelago, by Y. O. Fortier. Physical features, previous exploration, stratigraphic, structural, and economic geology are treated, selected references added. A final chapter, Pleistocene geology and surficial deposits, by V. K. Prest, deals with glacial events

and glacial and allied deposits. Plates, maps, and diagrams illustrate, and tables summarize, the information given in the text. A colored geological map of Canada, scale 1 in.: 120 mi. shows distribution and age of rocks, classified as sedimentary, volcanic, or intrusive.

CANADA. GEOLOGICAL SURVEY, *see also: Canadian weekly bulletin.* News notes. *1958.* No. 50123.

50088. CANADA. HYDROGRAPHIC SERVICE. Atlantic coast tide and current tables, 1959. Ottawa, Queen's Printer, 1958. 261 p. tables. (*Its:* Tidal publication no. 1.)

Annual forecast (in changed format) includes compilation of tide and tidal current tables for coast of Labrador (nine ports), tide tables for Hudson Bay and arctic waters (61 ports), tidal current information on Hudson Strait and Digges Sound. ***Copy seen:*** DN–HO.

50089. CANADA. HYDROGRAPHIC SERVICE. Great Slave Lake and Mackenzie River pilot. First edition. Ottawa, Queen's Printer, 1958. xix, 85 p. 2 fold. maps, tables. Prepared by E. J. Cooper.

Contains introductory notes on charts and navigation in general, lights and buoyage, signal systems and distress, urgency and safety signaling procedures; distances (17 points on the Lake and River); meteorological tables for Fort Smith (60°00′ N. 111°52′ W.), Aklavik (68°14′ N. 134°50′ W.), Fort Good Hope (66°15′ N. 128°38′ W.), Fort Simpson (61°52′ N. 121°15′ W.), and Fort Resolution (61°09′ N. 113°37′ W.), Chapters (11) follow on administration, products, etc., ice; sailing directions for Great Slave Lake: western shore, Slave Point to Fort Rae, Yellowknife Bay to Gros Cap, Stony Island to the Mackenzie River entrance, including the Slave River. Directions for Mackenzie River cover: Great Slave Lake to Fort Simpson, to Fort Norman, to Arctic Red River, to Mackenzie and Kugmallit Bays, including a description of the Mackenzie and Peel River deltas. Settlements, trading posts, port facilities, tributary streams, shore terrain, etc., are described briefly; data on navigation conditions, directions, etc., are given in detail. A useful index is added.

Copy seen: DLC.

50090. CANADA. HYDROGRAPHIC SERVICE. Labrador and Hudson Bay pilot; supplement no. 2 to the 1954 edition. Ottawa, Queen's Printer, 1958. 27 p.

Contains additions and corrections through Mar. 5, 1958 to No. 39136, including *Notice to mariners* no. 22 of 1958. ***Copy seen:*** DN–HO.

50091. CANADA. METEOROLOGICAL BRANCH. Canada location identifiers. Fifth ed., effec. Oct. 1, 1958. Replaces circular 2767, Mar. 23, 1956, and revisions. 30 p. (*Its*: Circular-3092, no. 409.)

Lists alphabetically and numerically, aerodromes, weather observing stations, radio range stations and aeronautical radio beacon stations, including those in Yukon Territory, Northwest Territories, northern Manitoba, Ontario, and Quebec. Prepared for needs of weather, communications, and air traffic control services in relation to air navigation.

Copy seen: DWB.

50092. CANADA. METEOROLOGICAL BRANCH, *and* **U.S. WEATHER BUREAU.** Climatological summary, Isachsen, N.W.T., Canada. May 1948 to December 1953. Toronto, 1958. 99 p., 4 text maps, diagrs., tables.

Contains meteorological data from Isachsen (78°47′ N. 103°32′ W.); with summaries from four other stations, viz., Alert, Eureka, Mould Bay and Resolute, established 1947–1950 by the Meteorological Branch and the U.S. Weather Bureau; the compilation constitutes first comprehensive data published for the northern part of the Canadian Arctic Islands. Station location and instruments are described. Tables are in three sections: summarized surface data; daily surface data; summarized upper-air data. Notes on relocation of instruments and resulting corrections are included. Establishment and resupply of the station is outlined. ***Copy seen:*** DN–HO.

50093. CANADA. METEOROLOGICAL BRANCH. Climatological summary, Mould Bay, N.W.T., Canada. Toronto, 1957. 92 p., 2 text maps, 9 diagrs., tables. (Joint Arctic Weather Stations: Canada, Meteorological Branch, and U.S. Weather Bureau.)

Describes station site and instruments. Some surface data are summarized for period Jan. 1949–Dec. 1953; other surface data tabulated by days. Upper air

data from twice-daily observations are tabulated by months and summarized graphically. Mould Bay station is located on Prince Patrick Island, at 76°14′ N. 119°20′ W.

50094. CANADA. METEOROLOGICAL BRANCH. Manice; manual of standard procedures and practices for ice reconnaissance. Provisional edition. Toronto, June 16, 1958. 32 p., 2 fold. maps. (*Its:* Circular 3061.)

Ice observing, recording and reporting procedures, etc., to be followed till World Meteorological Organization standards published. Terminology is noted; information to be shown on ice track charts is listed; format of ice messages is prescribed; observational techniques from shipboard are described. Appendices list ice symbols for track chart; give an example of chart; show coverage of observer's charts; list abbreviations used in messages. ***Copy seen:*** DN–HO.

50095. CANADA. METEOROLOGICAL BRANCH. Monthly record of meteorological observations in Canada. Sept. 1944–June 1956. Toronto, 1950–1959. In sequence to No. 2800. June 1956 issue: 99 p. maps, tables, refs. in text.

Records of: daily max. and min. temperature; daily precipitation; summary of observations of pressure, temperature, humidity, cloud, visibility and wind; temperature and precipitaion summaries; summary of winds at hourly weather reporting stations; summary of hourly winds; daily bright sunshine; mean percentage of bright sunshine registered in each hour of the day; summary of sunshine records; total daily solar radiation received on a horizontal surface. Maps show temperature departures (2° F. interval) and total precipitation (1-in. interval). Northern stations recording these elements were located, June 1956, in Yukon Territory (1–11 stations), Northwest Territories (6–39), District of Franklin, i.e., Arctic Islands (15), Northern Manitoba (0–5), Northern Ontario (0–3), Northern Quebec (2–18), and in Labrador (0 to 9 stations).

50100. ***CANADIAN GEOGRAPHICAL JOURNAL.*** The largest island, Greenland. (Canadian geographical journal, Nov. 1958. v. 57, no. 5, p. 166–71, illus.)

Description and photographs of the life of Greenland Eskimos. The Canadian Government's plans to send Canadian Eskimos to Greenland to observe their progress are noted. ***Copy seen:*** DGS.

50101. CANADIAN MINES HANDBOOK, 1958. Toronto, Northern Miner Press, Ltd., July 1958. 324 p. incl. tables, maps.

Basic reference work for Canada, includes: active and inactive mining companies, producers of leading metals, range of mining share prices 1951–July 1958, maps of mining areas (special map of Yellowknife area). ***Copy seen:*** DGS.

50102. ***CANADIAN MINING AND METALLURGICAL BULLETIN.*** Geological Survey places 77 parties in the field. (Canadian mining and metallurgical bulletin, July 1958. v. 51, no. 555, p. 414.)

The 1958 program includes projects on submarine geology of the continental shelf, exploration in the Western Arctic islands, reconnaissance in the mountains of Yukon, stratigraphic studies in western Canada, etc.; preparations are noted for three large aircraft-supported operations in 1959, to survey 205,000 sq. mi. of the Canadian North, two of them, the Pelly and Coppermine Operations, in Yukon and Northwest Territories, are to have helicopter support; the third will take geologists to Banks and Victoria Islands. Using light aircraft, 1958 parties will explore Melville, Brock, Borden and Mackenzie King Islands; Operation Fort George, started in 1957, will continue, mapping about 35,000 sq. mi. between James and Hudson Bays and the Labrador Trough. ***Copy seen:*** DGS.

50103. ***CANADIAN MINING JOURNAL.*** North Rankin nickel mines. (Canadian mining journal, Aug. 1957. v. 78, no. 8, p. 93–97, diagr., tables.)

Contains description of new nickel mine, located at 62°49′ N. 92°05′ W., on Rankin Inlet, west side of Hudson Bay, 320 air miles north of Churchill. Access, topography, history, geology, metallurgy (tabular analysis of test samples, and of copper-nickel concentrate), also water supply, power, surface equipment, mining method (cross section, flow sheet) and milling are dealt with. Personnel is given; general conditions, as permafrost, Eskimo workers, etc., are discussed. ***Copy seen:*** DGS.

50104. ***CANADIAN MINING JOURNAL.*** World's biggest ore-dressing plant helps double Lapland iron ore output. (Canadian mining journal, Mar. 1957. v. 78, no. 3, p. 82–83, diagr.)

Describes ore-dressing plant at Kiruna, northern Sweden, to be inaugurated Oct. 1, 1957. When completed, it will have eight pairs of magnetic dressing sections, each with capacity of 500 tn/hr. This plant is part of an improvement project set up by the nationalized company, LKAB (Luossavaara-Kiirunavaara Aktiebolaget). Climatic problems choice of materials to withstand extreme cold, and effective insulation are factors in construction. ***Copy seen:*** DGS.

50105. ***CANADIAN SHIPPING.*** Arctic two-way trade is established by brokerage-shipping combination. (Canadian shipping, Oct. 1957. v. 29, no. 1, p. 72, 74, illus.)

Notes establishment of scheduled cargo runs by Chimo Shipping Ltd./Gillespie-Munro Ltd. between eastern Canadian ports and Hudson Bay and Strait outposts. Northbound ships with machinery and supplies for mining properties, etc., are to return with mining products, grain screenings (port of Churchill), machinery used in construction of radar defenses, etc. ***Copy seen:*** DLC.

50106. ***CANADIAN SHIPPING.*** CGS. *Baffin* is new survey ship. (Canadian shipping, Apr. 1957. v. 28, no. 7, p. 34–37, illus.)

Describes ice-breaking vessel of 1,387 t.d.w. designed for hydrographic surveying in Canadian arctic waters and the St. Lawrence estuary. It is propelled by four 2,000 bhp diesel engines and has an action radius of 14,000 mi. Hydrographic equipment includes laboratories and a drawing office; two Bell helicopters and a fully equipped maintenance hangar are provided. ***Copy seen:*** DLC.

50107. ***CANADIAN SHIPPING.*** C. G. S. "d'Iberville" sails for arctic waters. (Canadian shipping, Aug. 1958. v. 29, no. 11, p. 72.)

The ice-breaker is to convoy five ships to Resolute Bay; then proceed to Eureka. An airborne reconnaissance patrol is to assist the convoy; the ships carry special equipment to speed landing of cargo at Resolute. ***Copy seen:*** DLC.

50108. ***CANADIAN SHIPPING.*** CGS Labrador in D. O. T. service. (Canadian shipping, Aug. 1958. v. 29, no. 11, p. 58–59, illus.)

Notes conversion of former Naval icebreaker to meet civil requirements, and its departure in July for arctic service.

Copy seen: DLC.

50109. ***CANADIAN SHIPPING.*** CGS Montcalm is in service; new D. O. T. icebreaker gives early promise of living up to expectation of wholly Canadian vessel. (Canadian shipping, Apr. 1957. v. 28, no. 7, p. 33, 54, illus.)

Describes the Canadian Dept. of Transport's combination ice-breaker - buoy-tender - lighthouse-service vessel. Twin propellers are driven by main propulsion machinery of two Vickers-Skinner direct-reversing Unaflow marine steam reciprocating engines, each developing 2,000 ihp. Deadweight is 1,116 tons, speed 13 knots.

Copy seen: DLC.

50110. ***CANADIAN SHIPPING.*** D. O. T. fleet lands huge cargoes. (Canadian shipping, Feb. 1958. v. 28, no. 5, p. 37, 44, illus.)

Notes operations of 49 commercial freighters and tankers, five ice-breakers, about 40 small craft, and 48 grain ships in the Canadian Arctic during 1956. Some 45,000 t. of supplies were delivered to the Mid-Canada and DEW Lines in addition to the (over 25,000 t.) annual re-supply of Canadian/U.S. weather stations in the Queen Elizabeth Islands.

Copy seen: DLC.

50111. ***CANADIAN SHIPPING.*** D. O. T. has built new dock at Frobisher Bay. (Canadian shipping, Sept. 1958. v. 29, no. 12, p. 47.)

Notes construction of a 750 ft. long, 40 ft. wide causeway to enable direct unloading of cargo ships; fuel is discharged from small tankers through a pipeline on the pier. ***Copy seen:*** DLC.

50112. ***CANADIAN SHIPPING.*** D. O. T. plans more ships. (Canadian shipping, Aug. 1958. v. 29, no. 11, p. 48–50, illus.)

Reviews Canadian Dept. of Transport's fleet in operation (123 vessels) and under construction (14); it has ten major vessels for northern duty. A fleet of smaller craft was converted in 1958 for landing operations in Foxe Basin, Hudson and Frobisher Bays. Areas of operation are indicated. ***Copy seen:*** DLC.

50113. ***CANADIAN SHIPPING.*** Large icebreaker is launched at Lauzon for Department of Transport fleet. (Canadian shipping, Nov. 1958. v. 30, no. 2, p. 41, illus.)

Notes launching, in Oct. 1958, of the *Sir Humphrey Gilbert*, a 220 ft., 4, 250 shp diesel-electric ice-breaker/supply and buoy tender, built at the Davie Shipbuilding yard. Main specifications are given; field of operation is to include service in the Arctic. ***Copy seen:*** DLC.

50114. ***CANADIAN SHIPPING.*** RCMP gets two patrol cruisers. (Canadian shipping, July 1958. v. 29, no. 10, p. 32.)

The 178 ft. cruisers, built by Geo. T. Davie & Sons of Lauzon and by Kingston Shipyards, have diesel engines (2) of 1,300 hp. and cruising range of 5,000 mi. They are designed for navigation in ice; and for use as medical vessels, with doctor's quarters, dispensary, X-ray equipment and arrangement to maintain cabin temperature at about 40° F. for transportation of Eskimos. Electrochemical treatment of sea water eliminates corrosion and clogging of suction pipes, condensers, etc. Both vessels (one named the *Wood*) are to be in service in 1958. ***Copy seen:*** DLC.

50115. ***CANADIAN SHIPPING.*** Two Department of Transport icebreakers will be added to already large fleet. (Canadian shipping, May 1957. v. 28, no. 8, p. 56, 58.)

Gives size and construction details on vessel of 3,380 t.d.w. and diesel-electric engines of 18,000 bhp. (three propellers), Canada's largest ice-breaker, being built by the Davie Shipbuilding Ltd., Lauzon, Quebec. The other, of 900 t.d.w., to operate on the west coast, is to be built by Yarrows Ltd., Victoria, B.C. Both vessels are equipped with helicopter flight decks. ***Copy seen:*** DLC.

50116. ***CANADIAN SHIPPING.*** U.S.S.R. develops atomic ice-breaker of 16,000 tons 44,000 HP. (Canadian shipping, Aug. 1957. v. 28, no. 11, p. 65, 76.)

The *Lenin* (launched in Leningrad Dec. 1957) is designed for convoy service on the Northern Sea Route. Six lbs. of uranium is adequate for a 10,000 mi. cruise. Greater cargo capacity and more economical operation are advantages of this powerful ice-breaker.

Copy seen: DLC.

50117. ***CANADIAN TRANSPORTATION.*** *Alexander Henry* launched at Port Arthur. (Canadian transportation, Nov. 1958. p. 62–63, illus.)

Notes launching in July 1958 of Canadian Government ice-breaking vessel built by the Port Arthur Shipbuilding Co. Two diesel engines of 1,775 hp. give the 2,440 t. vessel a cruising speed of 12 knots with a 6,000 mi. radius of action. Auxiliary equipment includes a helicopter and a 20 t. derrick for use in the inspection and maintenance service of buoys. Each propeller shaft has a built-in shock absorber to reduce effects on the machinery while ice-breaking; full stop is made from 150 rpm. in one revolution.

Copy seen: DLC.

50118. ***CANADIAN TRANSPORTATION.*** Deliver 8,000 tons of supplies to Arctic. (Canadian transportation, Jan. 1958. p. 61–62, illus.)

Notes completion of Operation NORS '57, during which five ships carried 8,000 t. of supplies from Quebec City to Resolute and Eureka. The ice-breaker *d'Iberville* and the supply ship *C. D. Howe* participated. ***Copy seen:*** DLC.

50119. ***CANADIAN TRANSPORTATION.*** Great Slave controversy. (Canadian transportation, July 1958. p. 34–35, map.)

Discusses choice of Waterways or Grimshaw, Alta., as terminus of a proposed railroad from Pine Point on Great Slave Lake. If Waterways is favored by the federal government, Grimshaw interests may be compensated by expansion and improvement of the Mackenzie Highway between Grimshaw and the Lake.

Copy seen: DLC.

50120. ***CANADIAN TRANSPORTATION.*** The ONR, quiet consistent service. (Canadian transportation, July 1958. p. 25–28, illus.)

Contains brief survey of financial status, equipment, and recent improvements of the Ontario Northland Railroad, operating over some 723 mi. with Moosonee (51°16′ N. 80°39′ W.) on James Bay as the northern terminus.

Copy seen: DLC.

50121. ***CANADIAN TRANSPORTATION.*** A unique rubber developed by G. E. (Canadian transportation, Oct. 1958. p. 65–77.)

Notes discovery by General Electric of an oil-resistant nitrile silicone rubber which maintains its physical properties at temperatures from −100° to +500° F.

Copy seen: DLC.

50122. ***CANADIAN WEEKLY BULLETIN.*** News notes. (Canadian weekly bulletin, Ottawa, 1957. v. 12, no. 1–52.)

Current news releases on:

Administration: plans for large publicly-operated day schools in the North for native and white children, replacing mission schools, and activities in public health and welfare work (no. 4, p. 3–4); third biennial summer school for teachers in Mackenzie District held at Yellowknife, late Aug.–early Sept. 1957 (no. 35, p. 2); cooperation by U.S. and Canadian governments with regard to DEW and Mid-Canada radar lines, cold-weather testing of weapons at Churchill, Man. (no. 47, p. 1–2); projected building by Canada of $650,000 "forward scatter" station near Gander, Nfld., and participation with some countries in joint financing of other stations of the N. Atlantic network in Greenland (Narssarssuaq) and Iceland (no. 14, p. 1–2).

Eskimos and Indians: three-month mechanical training course at Leduc, Alta., for 30 Eskimos to take responsible jobs on the DEW line, part of a long-term program for Eskimos' employment (no. 13, p. 3); savings of approx. $200,000 banked by some 235 Eskimos working on radar defences; their first use of banking facilities (no. 18, p. 4); all-Eskimo tape-recorded program and film to be shown aboard the *C. D. Howe* during Eastern Arctic patrol, summer 1957 (no. 28, p. 3); Eskimo carvings in Canadian Pavilion at Brussels Exhibition 1958 (no. 40, p. 8); Canadian Eskimo arts and crafts exhibit to tour Greenland settlements for two years (no. 28, p. 5); carving by Oshaweetuk from Cape Dorset, Baffin Island, presented to Nehru (no. 19, p. 5); employment of Indians in resource development and defense projects including Mid-Canada radar line, iron mines at Knob Lake, mining developments in northern Manitoba (no. 44, p. 5–6); 34 scholarships (over $25,000) for vocational and higher schools, available to Canadian Indians (no. 20, p. 5);

Expeditions, surveys, patrols 1957: Canadian Dept. of Transport's Operation NORS '57, the resupply of U.S.-Canadian arctic weather stations, hydrographic and aerial surveys, was carried out in 50 days, by five vessels (no. 27, p. 3–4; no. 48, p. 5); with helicopters based on

C. D. Howe and *d'Iberville* ice-scouting ahead (no. 52, p. 5–6); operation by Royal Canadian Navy of radio station at Frobisher, Baffin Island, July 1–Oct. 15, in support of seaborne supply of DEW Line sites (no. 48, p. 6); arctic patrol of HMCS *Labrador*, June–Oct. 1957, to survey DEW line supply routes and landing beach areas, to resupply sites, and carry out hydrographic and oceanographic surveys; its discovery of one deep-draft channel through Bellot Strait between Somerset Island and Boothia Peninsula, another between Resor and Pike Islands leading into Frobisher Bay, Baffin Island (no. 24, p. 4; no. 36, p. 5; no. 37, p. 5); Hudson Bay Route patrol throughout navigation season 1957 by icebreaker *N. B. McLean*, also, due to increased shipping, by the *Montcalm* (no. 29, p. 4–5); Canadian participation in IGY is mainly in the Arctic, with study of aurora, rockets at Ft. Churchill, and Operation Hazen, Defence Research Board's eight-man geophysical, geological and climatological expedition to the Lake Hazen area of northern Ellesmere, led by G. Hattersley-Smith (no. 5, p. 4; no. 18, p. 3; no. 27, p. 1–2, 6); summer field work by 72 parties of the Canadian Geological Survey, including Operations Mackenzie and Fort George (reconnaissance mapping by helicopter in the upper Mackenzie basin and northern Quebec); aeromagnetic mapping along the Manitoba-Northwest Territories boundary (no. 24, p. 3); geodetic, topographic, legal, and hydrographic surveys by the Surveys and Mapping Branch, Dept. of Mines and Technical Surveys, in Hudson Bay and Strait, Northwest Territories, northern Quebec, Canadian Arctic Islands and waters; completion of shoran network of geodetic control in northern regions; maiden arctic tour of Department's new ship *Baffin* (no. 28, p. 4); summer field work by National Museum parties in Labrador and Ungava Peninsula (mammals), muskeg area west of James Bay, northern Ontario (botany), Pelly Bay area of Keewatin (mammals, birds, plants), Whitehorse region, Yukon (mosses), Teslin Lake area, Yukon-B.C., Payne Lake in Ungava Peninsula, and northern Ontario (archeology), Fort Good Hope and Colville Lakes region of Mackenzie District (ethnology), Great Whale River area of northern Quebec (anthropology, sociology) (no. 25, p. 5–6); exploratory soil surveys by the Dept. of Agriculture in Yukon and Northwest Territories since 1943 indicate most promising areas are larger valleys of southern Yukon, Slave and Liard and upper Mackenzie valleys (no. 11, p. 3); traces of six cultures found in 97 ancient camp-sites (containing Mongolian-type artifacts) during R. S. MacNeish's survey of approx. 62,000 sq. mi. between Dawson and Whitehorse, Yukon (no. 44, p. 4, 6);

Natural resources: iron ore mining at Knob Lake, Quebec-Labrador, nickel-copper mining at Lynn Lake, N. Manitoba (no. 30, p. 1–3, 5–6); iron ore shipments from Knob Lake area in 1956, exploration and drilling for iron from the west coast of Ungava Bay south to Wabush Lake (no. 26, p. 5–6; no. 33, p. 4); water power resources in Labrador, Yukon, and Northwest Territories (no. 19, p. 5).

Wildlife: Convention for the Conservation of North Pacific Fur Seals signed in Washington Feb. 9, 1957, by U.S., Canada, Japan and U.S.S.R., prohibiting pelagic sealing, providing for scientific investigation of seals, controlling catches made on the Pribilof, Commander, and Robben Islands (no. 8, p. 5; no. 51, p. 2); Canadian and Norwegian seal fisheries off northeast Newfoundland and in Gulf of St. Lawrence with over 406,000 seals taken in 1956 (no. 15, p. 3); International North Pacific Fisheries Commission meetings in Tokyo, Mar. 1957, dealt with salmon, herring and halibut fisheries along coasts of Alaska, B.C. and U.S., the 1957 research program extended 1955–1956 programs from latitude of San Francisco to Bering Strait and west to Asian shores (no. 13, p. 3); Canadian Fisheries Research Board investigations into reserves in the Northwest Atlantic, including Grand Banks region (no. 6, p. 5), and in the North Pacific (no. 4, p. 10); Canadian Wildlife Service plans for 18-month observation of a caribou herd to study causes of population decline (no. 12, p. 3); Dewey Soper Bird Sanctuary established on southwest Baffin Island, first in far North (no. 34, p. 2); nine whooping cranes seen in Wood Buffalo Park June 1957, five on nests (no. 25, p. 2).

Miscellaneous: Canada's largest icebreaker to be built at Lauzon, Quebec, a 315 ft. ocean-going vessel with 20,000 mi. cruising range, suitable for arctic conditions (no. 16, p. 6); Dept. of Transport's ionosphere station at Resolute, Cornwallis Island, one of a network

including Baker Lake, Churchill, Winnipeg and Ottawa (no. 51, p. 4–5); Frobisher, Baffin Island and its air traffic development (no. 46, p. 4–5); Supt. H. A. Larsen to represent Canada at unveiling of monument to Otto Sverdrup, at Steinkjer, Norway, July 21, 1957 (no. 28, p. 6); Prime Minister J. C. Diefenbaker stresses importance of Canadian Arctic, Sept. 3, 1957 (no. 37, p. 4).

Copy seen: DLC.

50123. ***CANADIAN WEEKLY BULLETIN.*** News notes. (Canadian weekly bulletin, Ottawa, 1958. v. 13, no. 1–53.)

Current news releases on:

Administration: opening of a 20-classroom Federal school and hostel at Fort Smith, its vocational training program (no. 4, p. 5); Fort Churchill test-fire of guided missiles; NATO troops complete 4½ week training course, including 10 days' tactical exercises with high (2,390) wind chill factor (no. 6, p. 3; no. 7, p. 8; no. 10, p. 6); new public health service for the Yukon, by Dept. of National Health and Welfare with the territorial government (no. 9, p. 5); appropriation ($591,000) to expand Canadian Broadcasting Corporation's service to the North, including community stations and a 50-kw. shortwave station for programs to the Yukon and Mackenzie District (no. 25, p. 3); Northwest Territories Council: members, organization and functions, its 15th session, July 1958 (no. 28, p. 6); Inuvik, new site of Aklavik, its planned facilities (no. 30, p. 6); Princess Margaret Range on Axel Heiberg Island (no. 34, p. 1); Dept. of Transport's Aeradio Marine Radio station opened at Churchill to serve shipping, aviation, and areas outside the present communications network (no. 50, p. 6); schools opened at Resolute on Cornwallis Island and Spence Bay on Boothia Peninsula include adult education classes (no. 51, p. 2).

Eskimos: employment at Rankin Inlet nickel mines, and inland from west coast of Hudson Bay, at Coppermine, Baffin and Belcher Islands (no. 4, p. 4); 1958 Eastern Arctic Patrol to visit 28 settlements, transfer Port Harrison Eskimos to resettle at Grise Fiord, health services, moving pictures, origin and background of the annual Patrols (no. 27, p. 1–2); arctic char (*Silvelinus alpinus*) fishing at Frobisher Bay as part of Northern Affairs program to extend Eskimos' activities, shipments to southern markets (no. 33, p. 4); Canadian Eskimos' and administrators' visit to West Greenland in Sept. 1958 (no. 36, p. 6).

Expeditions, surveys, patrols: Canadian IGY activities at Fort Churchill, in Lake Hazen area of northern Ellesmere (no. 2, p. 6; no. 48, p. 3–4); Geological Survey mapping in 1957 of 10,000 sq. mi. in the oil and gas exploration area of the upper Mackenzie River drainage basin; 1958 projects include geologic mapping by helicopter of the Wholdaia area, southeast Mackenzie; air explorations of Melville, Brock, Borden and Mackenzie King Islands; mapping of 35,000 sq. mi. between James and Hudson Bays and the Labrador Trough as continuation of Operation Fort George 1957; preparations for three 1959 aircraft-supported projects: Operation Pelly in the Yukon; Operation Coppermine, to map approx. 60,000 sq. mi. in northern Mackenzie District; reconnaissance of stratigraphic and structural features of some 125,000 sq. mi. on Banks and Victoria Islands (no. 10, p. 1; no. 26, p. 5); Dept. of Mines and Technical Surveys prepares a six-year project to photograph 500,000 sq. mi. Arctic Islands area for later detailed topographic mapping; a similar mainland project completed is being mapped by the Topographical Survey at 4 mi.: 1 in.; Geodetic Survey's completion of shoran network for these projects (no. 10, p. 2); the *Baffin* added to hydrographic fleet of Dept. of Mines and Technical Surveys, work of the Hydrographic Service including charting of Hudson Bay and Strait routes for ore and concentrates shipments (no. 10, p. 2); plans to complete Saskatchewan-Northwest Territories boundary survey during winter 1958; experiment with tellurometer for electronic measurements of distance (no. 10, p. 3); Dept. of Transport's 1958 arctic supply mission (13 Dept. vessels, 22 chartered ships, 125 barges, landing craft, tugs) included DEW Line sites in the Foxe basin area, also Mid-Canada Line locations in Hudson Bay, joint Canadian-U.S. weather stations, other outposts (no. 20, p. 2; no. 32, p. 2; no. 49, p. 5); bird and animal life survey on Prince of Wales Island, by a National Museum party (no. 21, p. 4); Army Engineers survey of Wholdaia Lake-Fort Reliance region east of Great Slave Lake (no. 21, p. 5).

Transportation: model of a Canadian Army tracked vehicle designed for over-snow and tundra operations being tested

in a program of vehicle performance evaluation (no. 2, p. 6); use of nuclear power for ice-breaker propulsion under study by the Dept. of Transport (no. 5, p. 4); construction of 1,200 mi. of roads and six major bridges to further development of mineralized areas in Yukon and Northwest Territories (no. 14, p. 2–3); Navy initiates ice-forecasting service in Gulf of St. Lawrence, Hudson Bay and Strait, and the arctic coast, to be taken over by Dept. of Transport in 1959, summer stations to be set up at Churchill, Cambridge and Frobisher (no. 20, p. 3); causeway-type dock effects 50–75% savings in cargo-handling costs at Frobisher, now a stop on intercontinental air route (no. 38, p. 3).

Natural resources and economic development: Canol pipelines transfer from U.S. to Canadian ownership (no. 14, p. 6); oil exploration and development permits and programs (no. 18, p. 4; no. 47, p. 3; no. 49, p. 4); new edition of natural resources map of Canada, issued by Dept. of Mines and Technical Surveys, includes resources to northernmost Ellesmere (no. 34, p. 1–2); refinery for asphalt, and stove, diesel and bunker fuels established at Haines Junction by Alaska-Yukon Refiners and Distributors Ltd. (no. 45, p. 6); Ontario biologists to study the sturgeon fishery in U.S.S.R. (no. 50, p. 3); whooping cranes population up to 35 (no. 37, p. 6). ***Copy seen:*** DLC.

50124. CARALP, RAYMONDE. Le chemin der fer du Labrador. (Annales de géographie, July-Aug. 1957. Année 66, no. 356, p. 364–67, text map.) 2 refs. Text in French. ***Title tr.:*** The Labrador railroad.

A railroad to the St. Lawrence was essential to development of ore deposits at Knob Lake. Problems of topography, soil, climate and accessibility in construction of the Quebec North Shore & Labrador Railway are reviewed. The line was completed in Feb. 1954; its terminus at Seven Islands, facilities at Knob Lake and Oreway (midway station), rolling stock and other equipment are noted, with discussion of its operation and maintenance. Construction of the town of Schefferville at Knob Lake is also sketched. ***Copy seen:*** DGS.

50125. CARALP, RAYMONDE. L'introduction de nouvelles régions dans l'économie mondiale. (Revue de géographie de Lyon, 1957. v. 32, no. 1, p. 1–20, 3 text maps.) 23 refs. Text in French. Summary in English. ***Title tr.:*** The introduction of new regions into the world economy.

Technical progress makes possible exploitation of natural resources in areas physically unfavorable to man. New transportation facilities link these regions with the traditional industrial centers. Role of aircraft and railroad in development of the Knob Lake iron ore region of Quebec-Labrador is cited (with map showing routes to U.S. ports). The Alaska Highway, highway to Great Slave Lake, route to the Kolyma mines in the U.S.S.R. are mentioned as well as other examples from tropic and desert areas. ***Copy seen:*** DGS.

Title tr.: New chief forester in Norbotten county.

Interview with Gunnar Carlborg on forestry problems and plans for solving them. Forestry education with competent teachers, sufficient seed, local nurseries are required. Farm wood lots should be made economic and, in the hard-regenerative lappmarks, subsidized. Regulation of forest lots, essential, should be initiated by lot exchanges between state-owned and lumber company forests. Forestry should be represented in the county's agricultural board. Comments by Carl-Eric Dahlgren, q.v.

50128. CARLGREN, OSKAR HENRIK, 1865– . A survey of the Ptychodactiaria, Corallimorpharia, and Actiniaria; with a preface by T. A. Stephenson. Stockholm, Almqvist & Wiksell, 1949. 121 p. 4 plates. (Svenska vetenskapsakademien Handlingar, ser. 4, bd. 1, no. 1.) Approx. 330 refs.

Systematic classification of known sea anemones by one of the two leading authorities on the subject, with a preface by the other, who discusses their present agreement on the systematics and clarifies their earlier differences. All major groups of sea anemones are believed to be known but the classification is still to be enlarged. In the three orders described, 67 of the species representing 41 genera have arctic locations which range from the intertidal and littoral to depths of 3500 m. Several species are circumpolar. All the main polar areas are represented.

50129. CARLQUIST, CARL-GUSTAF. Markberedning i höjdlägen. (Svenska skogsvårdsföreningen. Tidskrift, 1950. årg. 48, nr. 4, p. 426–29.) Text in Swedish. ***Title tr.:*** Soil preparation on high ground.

Forest regeneration was examined on areas in southern Lapland and in Ångermanland at 300-500 m. altitude which had been scarified without burning over for the last 10 years. It was found that essentials for successful regeneration on the cut-over areas included: presence of 25–50 seed trees/hectare; sufficient ripening of the raw humus after cutting; a good seed year after scarification; careful siting of the treated patches; and a method suited to the climate and other local conditions. Failure in regeneration was most frequent when too much of the bleached layer was exposed, and spring drought after autumn rains had hardened the surface too much for seeds to grow. Transplanting of young plants from patches with dense regeneration is considered preferable to creating unevenaged stands by a further and more thorough scarification where regeneration has failed. ***Copy seen:*** DA.

CARLSON, CLARENCE J., *see* Alaskan Science Conference, 1954. Science . . . proceedings. *1957*. No. 49210.

50130. CARLSON, KEITH A. Successful low temperature operation of hydraulic systems. (Applied hydraulics, Nov. 1957. v. 10, no. 11, p. 69–72, +, illus., graphs, tables.)

Offers advice on fluid heating, starting, and choice of fluids, packings, hoses and accumulator bladders. A fluid viscosity range of 4000–70 SSU is considered acceptable for operation of hydraulic systems down to −65° F. A low-viscosity-index fluid may be preferable in certain applications, provided the oil is pre-heated. Directions for installation of electrical immersion heaters and thermostats are given, and arrangements for removal of condensation water from the hydraulic fluid are discussed. ***Copy seen:*** DLC.

50131. CARLSON, LOREN DANIEL, 1915– , *and others.* The combined effects of ionizing radiation and low temperature on the metabolism, longevity and soft tissues of the white rat; metabolism and longevity. Mar. 1957. 7 p. illus., tables. (U.S. Air Force. School of Aviation Medicine, Randolph Field, Tex. Rept. no. 57-78) 21 refs. Also pub. in *Radiation research*, 1957. v. 7, no. 2, p. 190–97. *Other authors:* W. J. Scheyer *and* B. H. Jackson.

Account of investigations on rats kept at 25° and 5° C. and exposed to total body irradiation of 0.1 r/hr for eight hrs. daily, from the age of 4 to 16 months. The animals at both temperatures had an increased life expectancy and those at 25° C. showed a higher resting O_2-consumption. ***Copy seen:*** DNLM.

50132. CARLSON, LOREN DANIEL, 1915– , *and others.* Immersion in cold water and body tissue insulation. (Journal of aviation medicine, Feb. 1958. v. 29, no. 2, p. 145–52, illus., tables.)

16 refs. *Other authors:* A. C. L. Hsieh, F. Fullington, *and* R. W. Elsner.

Account of experiments with subjects in whom fat constituted 8–32% of the body weight; the temperature of the bath ranged between 9° and 33° C. It was found that body insulation, calculated by the Burton equation, varied directly with specific gravity. The results seem to explain the wide variation in survival in cold water immersion.

50134. CARLSON, P. R., *and others.* Geology and mechanical stabilization of Cenozoic sediments near Point Barrow, Alaska. Ames, Iowa, Mar. 1, 1958. 78 p., plates, 34 maps, diagrs., tables. (Iowa. State College of Agriculture and Mechanic Arts. Ames. Engineering Experiment Station. Project 320–S. Final Report II. Contract Nonr–530(04), Geography Branch, Office of Naval Research) 47 refs. *Other authors:* K. M. Hussey, D. T. Davidson, R. L. Handy, and C. J. Roy.

Report on investigation, carried out during summers 1954, 1955, 1956, to integrate geological and engineering properties of construction materials in the vicinity of Barrow. Representative soil samples and pertinent field data were collected; five major quantity samples were tested in the soil-testing laboratory in Ames to determine mineralogical content, particle shape and size distribution, moisture-density and consistency relationships, and bearing strength values. The samples were composed of: clay, coarse gravel, fine gravel and sand, composite of all size gradations from gravel through clay, and sandy silt; all are evaluated for construction purposes. Location of the samples and geomorphic features of the Barrow area are shown (maps based on air photos). Climate, permafrost, inaccessibility and low trafficability are discussed as factors in the problems of the region; its stratigraphy, geomorphic features are outlined. Mechanical stabilization of locally available materials is recommended; also relatively well drained and naturally occurring sites, such as the beach and ancient beach ridges; a slightly dry soil mixture for greatest strength; avoiding crushing of gravel; and reduced subgrade strength in road and airfield construction.

50142. CARSON, P. J. Ice bridges. (Polar record, Jan. 1958. v. 9, no. 58, p. 18–19, diagr., illus. facing p. 20.)

Describes construction, including measurements, and maintenance of 24 ft.-wide bridges built during winter to replace ferries. They consist of a layer of wooden planks 1 in. thick, laid lengthwise with the bridge, flooded and frozen, the layers repeated, etc. Such bridges are capable of carrying 60 20-ton vehicles a day for more than four months. They are used mainly on the Mayo-Dawson road traveled by mining company trucks. ***Copy seen:*** DLC.

50143. CARSTENS, C. W. Norges forråd av mutbare mineraler, stillingen i dag og utsiktene for framtiden. (Tidsskrift for kjemi, bergvesen og metallurgi,

Feb. 1950. årg. 10, nr. 2, p. 21–24.) Text in Norwegian.

Title tr.: Norway's supply of workable minerals; present-day conditions and future prospects.

Norway is well supplied with mineral resources. In 1939 iron ore and pyrites accounted for 80% of the production. Some accessory minerals were lost because only 35% of the ores were refined in Norway. The largest iron reserves are in Sydvaranger and Dunderlandsdalen; others, in the far North, are: a large reserve of low grade nickel at Rana near Narvik, large amounts of calcium and magnesium in limestone and dolomite; beryl in useful quantities; and rich titanium deposits; copper, cobalt, molybdenum, and zinc are noted; gold is panned in Finnmark. ***Copy seen:*** DLC.

50144. CARSTENS, HARALD. Investigations of titaniferous iron ore deposits; pt. I, gabbros and associated titaniferous iron ore in the West-Norwegian gneisses; pt. II, gabbro, anorthosite and titaniferous iron ore on Flakstad in Lofoten, northern Norway. Trondheim, 1957. 67, 24 p. illus., tables, fold. map. (Norske videnskabers selskab, Trondheim. Skrifter, 4, 5.)

Titaniferous iron ore deposits in the gneiss area of western Norway occur both in gabbroic and anorthositic rocks; they were formed twice during the differentiation of the gabbros. At the middle stages when an iron-rich magma, sufficiently oxidized, had been formed as a normal product of crystal fractionation at high levels in the earth's crust, concentration occurred for the first time due to the accumulation of early formed iron ore in some parts of the mobile magma. These residual magmas later intruded the gneisses and gave rise to apatite-bearing titaniferous iron ore deposits. They are strictly late-magmatic, and a process like that suggested by J. D. Bateman might have been active in concentrating this element still more, as the iron crystallized later than the silicates.—From conclusion.

50147. CASE, JAMES BOYCE. Mapping of glaciers in Alaska. (Photogrammetric engineering, Dec. 1958. v. 24, no. 5, p. 815–21, illus., maps, diagr.) 7 refs.

Describes field work of IGY Project Y 4.11, sponsored by the American Geographical Society to map the Worthington, West Gulkana, Polychrome, Salmon Creek, Skolai, Kilbuck, Porcupine, Lemon Creek, and McCall Glaciers, the maps to be used primarily in study of changes in relation to long-range weather changes. A pilot project was carried out on Lemon Creek Glacier in 1955, 1957. Terrestrial surveys are correlated with aerial photography (from 15,000 ft.) to produce map manuscripts at scales 1:5,000 and 1:10,000 with a contour interval of 5 m. Surveying procedures and equipment are described; aerial photogrammetry is compared favorably to terrestrial; plotting results with the Kelsh and Wild A–7 plotters are evaluated. ***Copy seen:*** DLC.

50148. CASE, JAMES BOYCE. Photogrammetric mapping of the Lemon Creek Glacier, Alaska. Columbus, Ohio, 1957. 58 p. illus., tables, maps, diagrs. 24 refs. M.S. thesis to Ohio State Univer.

"The procedures in preparing a precise map of the Lemon Creek Glacier using photogrammetric materials are discussed; the difficulties encountered are pointed out: and solutions are suggested. A field survey conducted on the glacier in 1955 is described, including the location of control points and camera stations, phototheodolite exposure records, terrestrial and aerial photographs, and errors in survey data and their correction. Terrestrial and aerial photography are compared and evaluated, the advantages and disadvantages of both methods are pointed out, and the value of existing photographs of Lemon Creek Glacier for mapping is examined. The method used in plotting a map of the glacier is described, and the map manuscript is included."—SIPRE. ***Copy seen:*** OU.

Account of the transfer of 50 small fishing boats (seiners) via the Northern Sea Route to Petropavlovsk in Kamchatka, the author, a Lithuanian journalist, taking part in the voyage as a working seaman. The leader of the flotilla, the motor-vessel *Kholmsk*, left Kaliningrad (former Königsberg) in the Baltic Sea July 12, 1955(?) with some of the seiners, met the other vessels in the Barents Sea, and sailed via Murmansk, Yugorskiy Shar, Dikson; rounded Cape Chelyuskin with the ice-breakers *Sibirĉakov* and *Ermak;* visited Tiksi and Chaunskaya Bays, and with the ice-breakers, *Mikoĉan* and *Molotov* (the latter is not named in the text) negotiated the ice-packed De Long Strait, and rounded Cape Dezhneva. The vessels were overhauled in Provideniya Bay, made a trip to the Commander Islands, and arrived in best condition at Petropavlovsk. Events of the voyage and places visited (Murmansk, Kil'din Island and its Lake Mogil'noye, Dikson, Tiksi, etc.) are described; rescue of the crew of a wrecked Danish steamship, the *Haraldberg* in the Yenisey River mouth is recounted (p. 82–87). The network of polar stations, ice reconnaissance, ice-breaker aid and other facilities, industrial and cultural progress generally along the Northern Sea Route are emphasized, though alcoholism and diseases of Chukchis are also noted. From the visit to the Commander Islands (p. 147–61), the fur seal herd, sea lion hunting, sea otter preserve are described, also the smallest national group of the U.S.S.R., 383 Aleuts living on these islands. Reproduction of 58 photographs illustrate the text. A similar transfer of a hundred boats is said (p. 170) to be planned for the next (1956?) year. ***Copy seen:*** DLC.

A study of particulate matter in the air following the eruption of Mt. Spurr in 1953. The average particle load was not much higher than in some polluted industrial atmospheres of the United States. The chemical composition of the volcanic ash is also discussed.

Copy seen: CaMAI.

50161. CHANG, JEN-HU. Global distribution of the annual range in soil temperature. (American Geophysical Union. Transactions, Oct. 1957. v. 38, no. 5, p. 718–23, maps, graphs.) 9 refs.

Presents maps of annual range in soil temperature at 10, 30, and 120 cm. depths, based on data from 780 stations throughout the world, also temperature-range profile charts for 18 stations, including Cape Chelyuskin, Irkutsk, Resolute and Anchorage. Depth of invariable temperatures in middle and high latitudes is 15–20 m. Annual range in surface-soil temperature exceeds 45° C. in places in Siberia; thermal diffusivity is about 10–30% higher in frozen than in unfrozen ground. The rate of decrease of temperature range with depth tapers off abruptly at about ten cm. depth at Cape Chelyuskin; both the summer heating in the active layer and the radiational cooling in winter are limited to a thin layer. At Resolute and Anchorage the annual ranges of air temperature exceed those in the top layers because of the insulating effect of the snow cover.

50167. CHAPMAN, SYDNEY, 1888– , *and* **C. G. LITTLE.** The nondeviative absorption of high-frequency radio waves in auroral latitudes. (Journal of atmospheric and terrestrial physics, 1957. v. 10, p. 20–31, 3 tables.) 21 refs. *Also pub.* as: Alaska. University. Geophysical Institute. Contributions, ser. A, no. 27.

The nondeviate absorption in auroral latitudes is more irregular and often stronger than in subauroral latitudes. It is also greater and more frequent during the day than at night. Some suggestions are given as to possible contributing factors to this daytime absorption. It has been postulated that some of the primary bombarding particles generate X-rays which in turn penetrate further. A layer ionized by these X-rays may be an important factor in this absorption. Ionization of nitric oxide molecules may also contribute an appreciable amount. This ionization process occurs both during the day and even stronger at night but electron loss is offset by photodetachment which occurs only during the day. A tentative table for 30 Mc/s radio wave absorption at College, Alaska at noon and at midnight is given including values of the electron and ion densities and other atmospheric characteristics. ***Copy seen:*** DLC.

50168. CHARD, CHESTER STEVENS, 1915– . Archaeology in Soviet Asia, 1950–1951. (Kroeber Anthropological Society. Papers, Spring 1957. no. 16, p. 29–43.) Refs in text.

Includes (p. 32) A. P. Okladnikov's 1951 field work along the Angara and Lena Rivers, heading an expedition sponsored by the Institute of the History of Material Culture and others (No. 53728). The stratified habitation sites on the upper Angara confirm the Serovo-Glazkovo-bronze age sequences previously based only on burial complexes. Steatite fish lures (unique in Siberia) found in an upper Angara Kitoi-stage burial are said to resemble those used by Algonkian Indians. Neolithic burials at Verkholensk (upper Lena) support the postulated Isakovo-Serovo succession and show

earlier than previously supposed links with the middle Lena culture center.

50170. CHARD, CHESTER STEVENS, 1915– . New World migration routes. (Alaska. University. Anthropological papers, Dec. 1958. v. 7, no. 1, p. 23–26.) 8 refs.

Postulates the existence of a dry passage between ice-free Asia and Alaska during the low sea-level stage of Wisconsin glaciation, 11,000–8,000 years ago. A southern migration route, termed by the author Koryak corridor, is preferred: starting from the Amur River mouth, it skirted the Sea of Okhotsk along a level coastal shelf, proceeded to Anadyr Gulf thence along a landbridge via St. Lawrence Island to Alaska (cf. No. 50034). Another, northern route, from the Lena River mouth along the arctic coast to Bering Strait is considered, but as less likely, because this route could have been open only during interglacial times, and a water barrier must have existed at the Strait. The Kuril Islands-Bering Sea and the Aleutian Islands routes are dismissed as highly improbable, the depth of the surrounding waters precluding the existence of any land bridges.

50174. CHARD, CHESTER STEVENS, 1915– . Observations on the Lena Neolithic. (Asian perspectives. Far-Eastern Prehistory Association, American Branch. Bulletin, summer 1957. v. 1, no. 1–2, p. 183–98.) 8 refs.

A discussion of the neolithic finds in the Lena River valley based on A. P. Okladnikov's excavations and 1945–1955 publications (No. 47160, 49168). Two distinct regional subdivisions are recognized: a northern, in the tundra and forest-tundra zones, characterized by temporary camps and stone workshops of nomad reindeer hunters; and a southern, in the taiga region, developed by sedentary fishermen, with permanent dwelling sites. The artifacts (pottery, stone adzes, burins, etc.) found mainly in Lena habitation sites are contrasted with those of Lake Baykal burials. Though no chronological subdivision in periods is as yet possible, some cross-

dating to Baykal neolithic sequences is attempted and a maximum date of 2,500 B. C. for the middle and 2,000 B. C. for the lower Lena cultures suggested. The similarity of Taymyr Peninsula and Kolyma River finds to those on the Lena are noted. ***Copy seen:*** DLC.

50175. CHARD, CHESTER STEVENS, 1915– . Organic tempering in northeast Asia and Alaska. (American antiquity, Oct. 1958. v. 24, no. 2, p. 193–94.) 16 refs.

Suggests a Siberian origin of organic material tempering techniques used for Alaskan pottery. Animal hair, fish scale, fiber, grass and leaf tempering was known on the middle and lower Lena River and in Chukotka since the neolithic and bronze age (1500-1000 B.C.); in America grass temper is reported from the Old Bering Sea stage; hair temper is later, the earliest occurrence being on the Kobuk River, from 1250 to 1400 A.D. Feather tempering, widespread in Alaska from around 1350 A.D. on, seems unknown in Siberia; it may be a transfer of the original animal hair technique "to a more satisfactory medium on the American side." ***Copy seen:*** DLC.

50176. CHARD, CHESTER STEVENS, 1915– . An outline of the prehistory of Siberia, part 1; the pre-metal periods. (Southwestern journal of anthropology, Spring 1958. v. 14, no. 1, p. 1–33). 66 refs.

Presents a broad outline and guide to basic literature on the Paleolithic, Mesolithic and Neolithic of RSFSR east of the Urals; includes some correlation with European culture stages. Approx. 150 Upper Paleolithic sites (none earlier) have been discovered mainly in the upper Ob' and Yenisey valleys, the Angara and Selenga River basins and up the Lena River to 61° N. Of the Siberian Mesolithic, little is yet known; Okladnikov's non-ceramic microlithic Khina complex (in the Angara River valley and three sites in the Amur-Maritime region) corresponds culturally to late Mesolithic manifestations in the west. The neolithic sites, including those of the Lake Baykal and Lena River area (p. 8–16) excavated by Okladnikov (No. 24814, 47160, 31085, 41687, 41688), are dealt with in detail. The Neolithic of northeastern Siberia, from the Amur basin to Bering Strait and west to Kolyma River (p. 25–28) is discussed. The presence of the original Bering Sea sequences on Chukotsk Peninsula and the absence of Ipiutak are noted. Archeological material on Kamchatka is so scanty at present as to preclude definite dating and classification. The Magadan sites (No. 31080) excavated by Okladnikov, Levin, et al., are seen as a link between the Ainu and Eskimos, and between the cultures of interior Siberia and North America. ***Copy seen:*** DLC.

50177. CHARD, CHESTER STEVENS, 1915– . Physical types of the Amur-Sakhalin region. (Kroeber Anthropological Society. Papers, 1955. no. 13, p. 105–115, tables.) 5 refs.

A summary of Soviet anthropological investigations based mainly on M. G. Levin's field work in 1947 (No. 23803, 52784); cf. also No. 52785. Three main racial types are discussed: the Sakhalin-Amur group represented by the Gilyaks and to some extent the Ul'chi, the Tungus-speaking Paleosiberians or Baykal group (the Orok, Negidal), and the Ainu. Levin's anthropometric findings are tabulated and arranged to correspond to Debets' data on northeastern Siberia (No. 21378 and 39228). ***Copy seen:*** DLC.

50178. CHARD, CHESTER STEVENS, 1915– . The southwestern frontier of Eskimo culture. (American antiquity, Jan. 1957. v. 22, no. 3, p. 304–305, illus.) 3 refs.

Discusses the underground houses, stone, bone and pottery finds excavated in an Eskimo-type complex at the mouth of the Kanchalan River (65° N. 177° E.) in 1953 by V. V. Naryshkin (No. 41689). The site, tentatively dated within the Christian era by Okladnikov, shows affinities with artifacts (proto-Koryak?) from his 1946 excavations near Magadan; it represents a maritime culture linked to those of other Asiatic coastal areas rather than interior Chukotka; and suggests the prehistoric classic Eskimo cultures' southwestern limit as on the north side of Anadyr Zaliv between the river mouth and Enmylen. ***Copy seen:*** DLC.

50180. CHARLESWORTH, JOHN KAYE, 1889– . Cryoturbation. (*In his:* The Quaternary era, 1957. v. 1, p. 559–86, illus., maps.) 40 refs.

"The characteristics, origin, and distribution of permafrost, ground ice, periglacial and river- and lake-ice thrust phenomena are discussed. Two types of permafrost are distinguished, the passive type which is a relic, contains mammoth remains, and does not reappear when destroyed, and the active type, which corresponds to present conditions and reappears when destroyed. The existence of permafrost depends on air temperatures, ground drainage, elevation, ground cover, winter snow, and soil composition. Ground ice occurs as thin films, grains, veins, vertical wedges or horizontal sheets, and irregular masses of all sizes; it is widely distributed within the vertical and horizontal limits of frozen ground. Ground ice is believed to be a relic of glaciers or firn fields, flood ice, wind-driven snow, or snowdrift glaciers, or might have formed by sublimation and condensation or the freezing of water penetrating beneath peat and frozen ground. Solifluction, which may occur on slopes of as little as 2°–3°, is affected by the gradient and structure of the ground, the depth of the thawed layer, vegetation, precipitation, and daily temperature changes, and requires saturation either with repeated freezing and thawing or without regelation where precipitation is abundant. Solifluction gives rise on steep declivities to striped ground or stone stripes. Transition forms link this soil type with polygonal markings, which replace them on gentle slopes or nearly horizontal surfaces."—SIPRE.

50181. CHARLESWORTH, JOHN KAYE, 1889– . Drift ice. (*In his:* The Quaternary era, 1957. v. 1, p. 177–208, illus., tables, graphs, maps.) 375 refs.

"The types, characteristics, and origin of drift ice are treated in detail. Two types are distinguished: land ice which is discharged into the sea and which comprises icebergs and river ice, and sea ice. The formation, structure, types, dimension, distribution, and weathering of icebergs sre discussed, and the effect of sea ice on the discharge of icebergs and their movement is considered. Sea ice is classified into: primary growth types comprising ice crystals, slush, ice-rind, sludge-ice, pancake-ice, fast ice, young or bay ice, level ice, shore-ice, and (partly) ice foot; and secondary types formed by deformation of primary types, including ice field, ice flow, glaçons, growlers, cakes, lumps or fragments, brash, honeycombed ice, hummocks, pack-ice, and paleocrystic ice. The processes of formation of each type are described. The formation of lake and river ice, their structural characteristics, and factors determining freeze-up and breakup are discussed, and special attention is given to anchor ice."—SIPRE.

50182. CHARLESWORTH, JOHN KAYE, 1889– . Geological action of sea ice. (*In his:* The Quaternary era, 1957. v. 1, p. 587–91.) 75 refs.

"Material transport by floating ice, its erosive action, and deposits are discussed. The geological action of drift ice depends partly on its detritus, which it derives from falls from landslips, screes or avalanches, from steep hillsides, or by freezing on to beach shingles, sands, and shells when driven ashore. While drift-ice, on the whole, acts insignificantly on solid rock, it erodes greatly when driven into shoaling water by onshore winds, having the weight and force of the entire pack behind it. Sea ice striates rocks parallel

or perpendicular to the shore, depending on the type of ice. Bergs erode indirectly when calving or overturning by producing waves which cut cliffs and beaches and polish and smooth cliffs high above the high-water mark. Ice foot generally protects the coast against waves or floating ice, but sometimes is erosive when storm waves push it up the beach, where it erodes by plucking and nivation. Material carried by floes, bay ice, or bergs is either dropped along the coast or near the shore, or is deposited at sea as single erratics or shoals, banks, and islands."—SIPRE. ***Copy seen:*** DLC.

50183. CHARLESWORTH, JOHN KAYE, 1889– . The Quaternary era, with special reference to its glaciation. London, E. Arnold, 1957. 2 v. (xlvii, 1700 p.) illus., maps (1 fold.) charts, profiles. Approx. 2000 refs.

Encyclopedic reference work on the Quaternary era, in three parts: glaciology (208 p.) and glacial geology (p. 209–591) in v. 1; the Quaternary era in v. 2. In glaciology, the phenomena of precipitation, and the meteorological, physical, and chemical aspects of land ice and sea ice are dealt with. Glacial geology is treated under glacial erosion, glacial deposition, and periglacial processes. A few chapters in v. 1 are described separately, *supra et infra*. V. 2 presents historical and regional materials and reviews the development of thought and theory regarding major aspects of the Pleistocene. Source references on terminology are abundant, and conflicting views on many problems are discussed. General and systematic indexes are appended. Reviewed by R. F. Flint in *American journal of science*, June 1957, v. 255, no. 6, p. 440–42.
Copy seen: DLC.

50184. CHARLESWORTH, JOHN KAYE, 1889– . Transition ice. (*In his:* The Quaternary era, 1957. v. 1, p. 167–76, map, diagrs.) 106 refs.

The characteristics, types and distribution of transition ice are discussed. It is classified into: shelf ice, floating ice tongues, and ice foot. Shelf ice, which floats like sea ice but moves very slowly like land ice, consists of compressed snow and stratified, compact firn, whose grains grow and interlock downward more strongly due to mechanical settling and compaction without melting. The strata are horizontal and even, though the upper ones curve slightly to conform with surface irregularities of drifting snow. No solid ice is visible above the water line, except near pressure ridges in which firn has locally been converted into glacier ice. Shelf ice may owe its existence to snow drifted on an original sheet of sea ice or a piedmont of glacier ice, or to floating ice tongues expanding and coalescing to form rafts, cemented by interstitial sea ice and snow. Floating ice tongues are characterized by their surface convexity and triangular or rectangular cross section, depending on whether lateral calving takes place or not. Tongues are maintained by direct snowfall and glacier thrust from behind. The ice foot approaches glacier ice in structure but is distinguishable by its larger air inclusions, its salinity, and regular stratification. The various types of ice foot are noted.—From SIPRE.

50185. CHARLEWOOD, GEOFFREY H., 1909– . Exploration for metals in Manitoba. (Precambrian, June 1957. v. 30, no. 6, p. 12–14, port.)

Belt most prospected since World War II is from Flin Flon east to Herb Lake (55°45′ N. 99°45′ W.), thence northeast, parallel to and north of the Hudson Bay Railway. East of Herb Lake, outcrops are scarce, structure is characterized by marked lineaments differing in strike from that prevailing in the adjacent area. Rocks are principally granite gneiss with long narrow belts of sedimentary and volcanic rocks and derived gneisses intruded by basic rocks, granite and pegmatite. Principal ore minerals are nickel sulfides. West of Herb Lake lies a more extensively-prospected region of complexly folded volcanic and sedimentary rocks. Principal ore minerals are copper and zinc sulfides and gold. Discoveries at Moak, Mystery and Thompson Lakes, at Snow Lake, Herb Lake, and Lynn Lake are noted. ***Copy seen:*** DGS.

Title tr.: Forest marten and squirrel.

Squirrel is claimed by some zoologists to be the basis of the marten's diet, and the latter responsible for the decrease in squirrel population noticed over several areas in the U.S.S.R. From observations carried out in several regions, including the Lapland and Pechora-Ilych preserves, the author combats these views: squirrels represent no more than 26.5% of the food of martens, and marten pelts are worth 25 times as much as squirrel. The decrease in the squirrel population is attributed to the poor cone crop which has occurred in several coniferous areas of the Soviet Union in the last four years. ***Copy seen:*** DLC.

Summarizes difficulties encountered and construction methods used in Alaska and Canada. Schedules, terrain, design conditions, building types, building and tower foundations, construction of garages, hangars and radomes, also mechanical and electrical designs are described. The importance of airstrips, the Canadian contracts, plans and achievements for 1955 and 1956 are reviewed.

Copy seen: DLC.

50198. CHEEVER, M. S. The DEW Line's construction seasons. (Engineering and contract record, Oct. 1957. v. 70, no. 10, p. 100–101, illus.)

Some of the special engineering problems resulting from the weather conditions, frost action, and permafrost are discussed briefly. Summer favors construction in the Arctic but the high frequency of fog delays transportation of key personnel between jobs; and soil thawing restricts wheeled vehicles to roads and requires special care with track-laying equipment. Much of the construction can continue during the winter but at high cost. The cold, high wind, and snow reduce efficiency, cause vehicle immobility, and generally increase the maintenance overhead. The problem of providing adequate drainage is particularly acute at the beginning of the melting season. ***Copy seen:*** DLC.

50204. CHEREPANOV, N. V. Opredelenie vozrasta dreifuiushchikh l'dov metodom kristallooptícheskogo issledovaniia. (Problemy Arktiki, sbornik statei, 1957, vyp, 2, p. 179–84, illus., diagrs.) Ref. Text in Russian. ***Title tr.:*** Determination of the age of drift ice by the crystal optics method.

Data on the crystalline structure and thickness of ice collected from the drift station North Pole-4 in 1954–1956 are tabulated, and the effects of temperature, freezing, and melting on ice structure are analyzed. Microscopic study of ice slides from winter and summer ice showed large difference in structure; analysis of the drift-station ice indicated an age of about nine years with annual layers 25–48 cm. thick. An ice-cover thickness of about 3 m. is the maximum limit for the area traversed by the station, annual growth (occurring only at the lower surface) averages 30–35 cm.—From SIPRE. ***Copy seen:*** DLC.

50205. CHEREPANOV, V. A. O stratigrafii i vozraste pestrotsvetnoĭ tolshchi v verkhov'iakh r. Fad'iu-Kuda na tsentral'nom Taĭmyre. (Leningrad. Nauchno issledovatel'skiĭ institut geologii Arktiki. Informatsionnyĭ biulleten', 1957. vyp. 5, p. 41–42.) Text in Russian. ***Title tr.:*** On the stratigraphy and age of the variegated stratum in the upper Fad'yu - Kuda River in central Taymyr Peninsula.

Describes location, position, thickness, composition and stratigraphic division of the terrigenic stratum lying on the Permian layer. The presence of marine Pelecypoda suggests that the stratum developed between the Permian and Triassic periods. ***Copy seen:*** DGS.

Account of a meeting at Novosibirsk, May 15–19, 1958. The opening address of the chairman of the Presidium of Siberian Division (M. A. Lavrent'ev) and reports of branch chairmen and scientific directors are summarized. Several multi-purpose scientific expeditions were announced by N. N. Nekrasov, (chairman of the Siberian Council for Expeditionary Exploration), including three to Krasnoyarsk Province, the lower Ob' basin, and Kamchatka. Need for further development of permafrost studies in Yakutia was noted by P. F. Shvetsov. ***Copy seen:*** DLC.

50208. CHERNETSOV, VALERIÏ NIKOLAEVICH, 1905– . Nizhnee Priob'e v I tysîacheletii nashe͡ĭ ėry; obzor i klassifikatsiîa materiala. (Akademiîa nauk SSSR. Institut istorii material'noĭ kul'tury. Materialy i issledovaniîa po arkheologii SSSR, 1957. no. 58, p. 136–245, illus., maps, diagrs.) Approx. 50 refs. Text in Russian. ***Title tr.:*** The lower Ob' region in the first millennium A. D.; review and classification of the material.

Systematizes and establishes a chronological sequence for the archeological finds of the second through the 13th century A. D. relating to the Ugric population of the lower Irtysh, middle and lower Ob River systems and the Yamal Peninsula. The material belongs to a culture divided according to its pottery ornamentation into four consecutive stages. Originating in the Ust' Poluy culture (cf. No. 34124), it is attributed to the ancient Ostyaks; it remained free of foreign infiltration for at least 1,000 years. The pottery, bronze, iron, etc., artifacts, burials and habitation sites are dealt with; trade links with the Kama and Volga are noted. The material culture of these arctic hunters is likened to that of the Eskimos and settled Chukchis: locally-manufactured wooden, stone and bone artifacts, imported iron tools, kayak-like boats, seal and bird-skin clothing, whalebone-supported pithouses, etc. This aboriginal Yamal and lower Ob' population was conquered and assimilated in the second half of the second millennium A. D. by Samoyed tribes. ***Copy seen:*** DLC.

50209. CHERNETSOV, VALERIÏ NIKOLAEVICH, 1905– . Ornament lentochnogo tipa u obskikh ugrov. (Sovetskaîa ėtnografiîa, 1948, no. 1, p. 139–52, illus.) 12 refs. Text in Russian. ***Title tr.:*** Ribbon-type ornament of the Ob' River Ugrians.

Discusses the decorative motives used in stylized animal or plant designs still popular among the Ostyaks and Voguls of the Severnaya Dvina, Loz'va, Kazym, Vakh and Vas-Yugan River valleys. Exclusively a woman's art, this ornament is carved or chiselled into stained birch bark vessels or cut from contrasting fur, leather, fish-skin, felt, etc., and sewn on clothing. The original totemistic or magic importance of the animal representations are speculated upon. The ribbon-type ornamentation found on bone, metal and ceramic artifacts of the bronze and early iron age in the Ob' area and its diffusion in the Andronov culture region are noted.

50210. CHERNETSOV, VALERIÏ NIKOLAEVICH, 1905– . Sokrashchennoe izlozhenie vystupleniîa. (Akademiîa nauk SSSR. Institut îazykoznaniîa. Doklady i soobshcheniîa, 1956. no. 9, p. 154–55.) Text in Russian. ***Title tr.:*** Resumé of address.

Analyzes the historical formation of the languages and dialects of the Ostyaks and Voguls by discussing the progressive settlement of the lower Ob' region in prehistoric times. First settled by tribes of the Lena and Angara basin, the region was overrun by several migratory waves from the south in the third through the first millennium B.C., resulting in the evolution of several Ugric groups. Traces of Paleoasiatic (Paleo-Siberian) elements are being discovered in Samoyed (Nenets and Sel'kup) and Ostyak languages. Summary of a paper read at the Feb.

17–19, 1955 session of the Learned Council of the Institute of Linguistics (Uchenyĭ sovet In-ta ĵazykoznaniĵa) of the Academy of Sciences U.S.S.R. devoted to the discussion of the theory of linguistic substrata. ***Copy seen:*** DLC.

50211. CHERNETSOV, VALERIĬ NIKOLAEVICH, 1905– , *and* V. I. MOSHINSKAĬA. V poiskakh drevneĭ rodiny ugorskikh narodov. (*In:* Po sledam drevnikh kul'tur, v. 3, 1954. p. 163–92, illus. incl. col.) 2 refs. Text in Russian. ***Title tr.:*** In search of the ancient homeland of Ugric peoples.

Discusses the Ust'-Poluy culture (4th century B.C.–1st century A.D.) at the confluence of the Poluy and Ob' Rivers (cf. No. 34124). The material culture of this hunting and fishing people, regarded as forebears of the Ostyaks and Voguls, is dealt with; their stone, bone, wood, bronze and iron artifacts and geometrically ornamented pottery are described: spears, bows and arrows, daggers and battle axes, harpoons and fishhooks, parka-like clothing, dog-driving, birchbark boats, rectangular pithouses with drainage ditches, fortified settlements suggesting frequent armed conflicts, etc. Though no burials were found, realistic sculptures and masks show both Europoid and Mongoloid features marking the lower Ob' as a meeting place of different ethnic groups, a fact confirmed by archeological analogies to Paleoasiatic (Eskimo, Yukaghir, Samoyed) and Ugric cultures. The middle courses of the Ob' and Irtysh Rivers are suggested as common ancestral land of all Ugric-speaking peoples. ***Copy seen:*** DLC.

50227. CHEVALLIER, RAYMOND, *and* **S. MATHIEU.** Susceptibilité magnétique specifique de pyroxènes monocliniques. (Société chimique de France. Bulletin, May 1958. fasc. 5, p. 726–29, 2 tables.) 8 refs. Text in French. ***Title tr.:*** Specific magnetic susceptibility of monoclinic pyroxenes.

Variation of magnetic properties with chemical composition in monoclinic pyroxenes are studied on the basis of 14 samples from the Skaergaard intrusion (68°10′ N. 31°40′ W.) of East Greenland. The ferrogabbros of this intrusion are exceptionally rich in iron, hence the extracted monoclinic pyroxenes, which range from diopside through augite to hedenbergite, are of particular interest. Chemical analysis showed their magnetic ions were Fe^{2+}, Fe^{3+} and Mn^{2+}. From the known magnetic moments of these ions which were presumed to exist independently without interaction, the theoretic magnetic susceptibility of each sample at 20° C. was calculated according to the paramagnetic law of Langevin. Magnetic susceptibility was likewise measured, despite complications due to impurities (mainly exsolutions containing rods of magnetite). The calculated susceptibilities and measured values were compared and found in good agreement. The magnetic ions and especially Fe^{2+} contributed to the magnetization of the mineral with their habitual moments; there was no positive or negative interaction; and the susceptibility of the pyroxene followed Curie's Law except for the samples which had the greatest concentrations in the magnetic ions.

50238. CHISTÎAKOV, G. E. Vskrytie i zamerzanie r. Leny. (Meteorologiîa i gidrologiîa, Jan. 1958, no. 1, p. 44, table.) 2 refs. Text in Russian. ***Title tr.:*** Freeze-up and breakup of the Lena River.

Freeze-up and breakup dates are tabulated for the city of Yakutsk for the periods 1827–1899, 1900–1955, and 1827–1955. The latest breakup recorded was June 7 (1843); the earliest May 7 (1943). The mean breakup dates vary from the upper reaches to the mouth of the river: from May 1 at 3,985 km. upriver to June 6 at 215 km. from its mouth, the breakup front moving with a speed of 100 km./day. Breakup in the 20th century averaged one week earlier than in the 19th due to climatic warming. The freeze-up front moves three times faster than the breakup front.—From SIPRE.

50239. CHISTÎAKOV, V. I. Kompleksnaîa mekhanizatsiîa ėkskavatornogo sposoba dobychi torfa. (Mekhanizatsiîa trudoemkikh i tîazhelykh rabot, Aug. 1958. god 12, no. 8, p. 13–16, illus.) Text in Russian. ***Title tr.:*** Mechanization of excavating methods in peat production.

Studies of peat-excavating, -collecting and -turning machines are analyzed with respect to productivity. Performance characteristics of two universal machines of new design are described. The axial-spinal crusher (MDO–2), installed on the single-row multi-bucket excavator (TEMP–2) is shown and compared with an old model. ***Copy seen:*** DLC.

50240. CHITTLEBOROUGH, R. G., *and* **K. GODFREY.** A review of whale marking and some trials of a modified whale mark. (Norsk hvalfangst-tidende, May 1957. årg. 46, nr. 5, p. 238–48, illus., tables.) Text in Norwegian and English. 10 refs.

The whale mark developed by *Discovery* investigations in 1926 and now in general use is criticized: it may cause serious injury to young animals and, being completely embedded in the body, it is frequently missed at the factory. Experiments carried out in Australia at Carnarvon in Sept. 1956 and Albany Dec. 1956, with a modified type are described in detail. The performance of the modified mark was considered satisfactory and further development is planned. ***Copy seen:*** DLC.

Contains preliminary report on excavation of a 200-sq. m. site near the mouth of Isfjord, July 22–Aug. 27. Named Russekeila, the site contained several well-built wooden huts, presumably brought to the island. The camp was apparently last used about 1760–70. Over a thousand artifacts (hunting- and fishing equipment, articles of personal and domestic use, etc.) were collected and given to the Tromsø Museum, which sponsored the expedition. The six-man party, headed by the writer, included scientists from all the Scandinavian countries. Their work is discussed by I. P. Shaskol'skiĭ, q.v. ***Copy seen:*** DLC.

50258. CHRISTIE, ROBERT L. Geological reconnaissance of the north coast of Ellesmere Island, District of Franklin, Northwest Territories. Ottawa. Queen's Printer, 1957. 40 p., 4 plates, fold. map, table. (Canada. Geological Survey. Paper 56–9.) 13 refs.

First field study of the Ellesmere Island north coast from Cape Columbia (83°10′ N. 70°30′ W.) to Lands Lokk (81°40′ N. 91° W.), made by the author, while member of the joint Canada-United States Northern Ellesmere Island Ice Shelf Expedition of 1954. Exploration of the area (accessible by dog team or aircraft), since Nares' British Arctic Expedition of 1875–76 is reviewed.

Methods of travel, topography, climate, vegetation and game are briefly described. General geology, including formations, rock types, fossils collected, age correlation, evidence of more extensive former glaciation, existing glaciers, and probable origin of ice islands, is given in greater detail. Structural features and a few mineral deposits are noted.

Copy seen: DGS.

50259. CHRISTIE, ROBERT L. Operation Hazen 1957. (Arctic circular, Aug. 1958. v. 11, no. 1, p. 2–7.)

Describes an eight-man expedition to northern Ellesmere Island in summer 1957, led by Dr. Geoffrey Hattersley-Smith and organized by the Defence Research Board as part of Canada's IGY program. Glaciological, geophysical, climatological, geological and limnological studies were made. A base camp was established at Lake Hazen north of Johns Island, and an icecap station near Gilman Glacier in the United States Range. Preliminary findings from geophysical and glaciological data collected, also the geology, are summarized.

50260. CHRISTIE, ROBERT W. Bacterial variations in the nasopharynx and skin of isolated arctic scientists. (New England journal of medicine, Mar. 13, 1958. v. 258, no. 11, p. 531–33, tables.) 9 refs.

Report of a study of seven members of a Greenland icecap party during their isolation of 100 days. Changes in distribution of the bacterial flora are noted and correlated with earlier findings. *Baccillus subtilis* and staphylococci were ubiquitous, especially in the skin. Two members who did not wash during the period of observation showed no deleterious effects. ***Copy seen:*** DNLM.

50261. CHRISTIE, ROBERT W. Medical notes Greenland Ice Cap expedition. (American Medical Association. Journal, July 20, 1957. v. 164, no. 12, p. 1314–1317, tables.) 2 refs.

Notes of the physician of Project 12 of the Snow Ice Permafrost Research Establishment, a six-man party which traveled in weasels approx. 1,200 miles on the Inland Ice during a hundred days in 1955, collecting scientific data, altitude to approx. 12,000 ft., air temperature 31° F. to −30° F. Sinusitis and other respiratory disorders were the most common complaint. A sudden fall of hemoglobin and erythrocyte count became apparent in all members soon after setting out and despite excellent food. Diarrhea, possibly influenza and irritability made up other complaints. Drugs used and essentials for polar medical and emergency kits, are listed. ***Copy seen:*** DLC.

50262. CHRISTOFFERSEN, RAGNAR. Sulitjelma gruber. (Tidsskrift for kjemi, bergvesen og metallurgi, Mar. 1950. årg. 10, nr. 2B, p. 130–33, illus., graph.) Text in Norwegian. ***Title tr.:*** Sulitjelma mines.

The minerals at Sulitjelma are believed to have concentrated at the contact between a gabbro intrusive and Cambrosilurian slates in a local anticlinal structure during progressive metamorphism. The mineralized zone extends N/S over 20 km. distance. Recent investigations indicate a similar zone at a lower level. Mineralogic composition and variations of the pyrites, sulphides, copper and zincblende are described. Cobalt, antimony, and lead are also noted among 23 known minerals there. Eleven mines are cited. General features of the history, mining, concentration, smelting, and of the operational facilities are outlined. Production has risen steadily since 1894.

Contains brief characteristics of 13 layers of Permian deposits on the banks of Pinega River in Arkhangel'sk province, and descriptions of the remains (two skulls, lower jaws and miscellaneous bones) of these fossil reptiles discovered in the fall of 1955. This is the first large find of pelycosaurs in the U.S.S.R. The geological age of the deposits is probably the lower Ustinian series of the Permian system. ***Copy seen:*** DLC.

50266. CHUMAKOV, A. A., *and* **I. V. GINZBURG.** Novaîa redkometal'naîa geokhimicheskaîa provintsiîa na Kol'skom poluostrove. (Akademiîa nauk SSSR. Doklady, May 11, 1957. t. 114, no. 2, p. 400–403.) 5 refs. Text in Russian. ***Title tr.:*** A new rare-metal geochemical province on the Kola Peninsula.

Structural-geology and lithologic-stratigraphy of the "Voron'ye - Poros-ozero" formation are described. The first location of lithium was discovered by the authors in the region of Lake Poros in 1947 in pegmatitic rocks in association with leucocratic granites. The formation described is typical of complex rare-metal pegmatitic formations in this province with predominance of lithium. ***Copy seen:*** DLC.

50267. CHUMAKOV, A. A. O proiskhozhdenii shchelochnykh granitov Kelv. (*In:* Akademiîa nauk SSSR. Kol'skiĭ filial. Shchelochnye granity Kol'skogo poluostrova, 1958. p. 308–368, illus., plates, tables, incl. 1 fold., diagrs. incl. 1 fold.) Text in Russian. ***Title tr.:*** On the origin of the Keyvy alkaline granites.

Analyzes in detail the structural-geologic, mineralogic and petrochemical properties of the Keyvy alkaline granites, and outlines their origin and development. The author disagrees with those who consider that alkaline granitic magma erupted from depth in a single stage intrusion and provoked metasomatic transformation in the surrounding country rocks. He assumes that the Keyvy massif represents an independent geologic structure, and recognizes two phases of intrusion, of which the alkaline granites of the second, main phase, have to be considered as magmatic-siallite intrusive formation. According to structural-geologic criteria, the Keyvy alkaline granite complex is divided into three groups of rocks: strictly magmatic; alkaline and subalkaline; and gabbro syenite, syenite and alkaline syenite. Each group is treated in detail and a further division is made. Their mineralogic and petrochemical properties are analyzed. ***Copy seen:*** DLC.

50268. CHUMAKOV, E. I. Sel'skaîa srednîaîa shkola. (Narodnoe obrazovanie, Jan. 1954, no. 1, p. 58–62.) Text in Russian. ***Title tr.:*** Rural high-school.

Discusses the problems of secondary education in the northern districts taking as example a high-school at Verkhnyaya Toyma (62°15′ N. 45°05′ E.), on the Severnaya Dvina River, Arkhangel'skaya Oblast'. The school serves an area with a 100–150 km. radius, has boarding facilities and provides, in addition to regular courses, practical training in agriculture, agronomy, home economics, etc. The lack of transportation for non-residents and resulting curtailment of extra-curricular activities, vacation homeleaves for boarders, are discussed, also the summer work in kolkhozes and difficulties in attending classes during harvest time. An insufficient number of parallel grades necessitating rejection of applicants, and inadequate preparation pro-

vided by some rural elementary and junior-high schools, etc., are dealt with. The need of enlarging existing schools or building new ones in outlying northern taiga areas is stressed. ***Copy seen:*** DLC.

50269. CHUMAKOV, N. M. Novye dannye o geologicheskom stroenii ûgo-zapadnogo obramleniâ Vilûiskoĭ vpadiny. (Izvestiâ vysshikh uchebnykh zavedenil; Neft' i gaz, 1958, no. 3, p. 25–31, cross-sections, map.) 14 refs. Text in Russian. ***Title tr.:*** New data on the geological structure of southwestern border of the Vilyuy depression.

Outlines the stratigraphy and tectonics of the Nyuya River area of Yakut A.S.S.R. Study of the geological structure of this area (the Nyuya, left tributary of Lena, and its right tributaries, Bol'shoy and Malyy Patom, approx. 60° N. 111° E.) may throw light on underlying formations of the Vilyuy depression and facilitate the search for oil-bearing rocks.

50273. CHURCHILL, ETHAN D. Phytosociological and environmental characteristics of some plant communities in the Umiat region of Alaska. (Ecology, Oct. 1955. v. 36, no. 4, p. 606–627, illus., tables.) 23 refs. Ph. D. dissertation to Catholic University of America.

Study based on field work conducted in mid-summer 1951, on the Arctic Slope near the Colville River, at 69°22′ N. 152°08′ W., elevation ranging from 340 ft. on floodplain to 950 ft. on upland. The stand was considered as unit of investigation. The vegetation was found to be generally "6 to 12 inches high, consisting of dwarf heath shrubs, dwarf birches and willow, intermingled herbaceous species and, in places, alders and willows from 3 to 8 ft. high." Five types of stands are distinguished, some divided into subtypes. The environment was found to be rigorous (average annual temperature +10.7° F., lowest −63° in Feb., highest 85°, July) with low precipitation with no freeze-free season, and permafrost underlying at small depth. The frequency of the more common vascular plants is also discussed. ***Copy seen:*** DLC.

Account of blood flow in the arm submerged in water of 2° to 42° C. "Blood flow fell with decreasing temperature, but below 14° C., it increased again until at 2° C. the flow was slightly greater than at 34° C." ***Copy seen:*** DNLM.

50286. CLARKE, R. S. J., *and others.* The duration of sustained contractions of the human forearm at different muscle temperatures. (Journal of physiology, Oct. 1958. v. 143, no. 3, p. 454–73, illus., table.) 33 refs. *Other authors:* R. F. Hellon *and* A. R. Lind.

Account of experiments with four subjects having their arm immersed in water of 2° to 42° C. Maximum tension that could be exerted was after immersion in water of 18° C. or more. In water below 18°, exerted tension fell with falling bath (and muscle) temperature, to some 40% in water of 2° C. An analysis of results suggests that at muscle temperatures below 27° C. the more superficial fibers do not contract owing to nervous or neuromuscular interference in transmission due to cooling.

Deals with gold-bearing ores of the Giant Yellowknife property in Mackenzie District (approx. 62°27′ N. 114°21′ W.) with particular attention to the relationship of gold to other metallic minerals. It is concluded that there were three periods of mineralization from hydrothermal solutions of magmatic origin. Each period is characterized by its own group of minerals and environment of deposition. Conditions during mineralizations varied from high temperatures and pressures during the first period to relatively mild temperatures and pressures during the third period. Most of the gold was deposited during the first period of mineralization and the deposit of mineralization and the deposit is classed as hypothermal. The association of arsenopyrite with gold is thought to be a product of time and space rather than the result of chemical affinity. The rare aurostibite is believed to have formed by the interaction of S-deficient antimonial solutions with pre-existing gold.

50303. COLLINDER, STEN. Sambandet mellan husbehovsförbrukningen av brännved och temperaturförhållandena. (Svenska skogsvårdsföreningen. Tidskrift, 1956. årg. 54, nr. 2, p. 195–200, tables.) Text in Swedish. ***Title tr.:*** The relationship between household use of firewood and temperature conditions.

Household use of firewood in Sweden is reported to have declined 30–40% over 20–30 years, in Norrland, about 30%. Improved heating systems and increased use of other fuels are important factors in the decline. The data of these reports are scrutinized for possible errors in both collection and evaluation; and the need suggested to consider winter temperatures as a factor of importance. The wood supply, normally calculated in the fall, should be correlated with the following winter's temperatures, ordinarily spread over the meteorological records for two consecutive years. Means of determining each of these interrelated factors must be improved before the results can be of value. ***Copy seen:*** DA.

struction, May 1956. v. 94, no. 5, p. 46–47, +, illus., map.)

Discusses the Territorial administration brief to the Royal Commission on Canada's Economic Prospects, outlining mining potentials and road requirements. Wartime and postwar role of the Northwest Highway System, especially the Alaska Highway, and need now of branch highways for resource development are stated. Five proposed roads are specified, viz: Carmacks-Ross River; Watson Lake-Frances Lake-Ross River; Aishihik Airport northwestward; Dawson-Fort McPherson; and from Keno down the Wind River. For each route (cf. map) the economic potential of the locality is shown. ***Copy seen:*** DLC.

50306. COLLINS, FLORENCE RUCKER, *and* **H. R. BERGQUIST.** Test wells, Meade and Kaolak areas, Alaska, with micropaleontology of Meade Test well 1 and Kaolak test well 1, northern Alaska. Washington, D.C., U.S. Govt. Print. Off., 1958. p. 341–76, illus., 3 text maps, 2 diagrs., tables, fold. graphic log. (U.S. Geological Survey. Professional paper 305–F. Exploration of Naval Petroleum Reserve no. 4 and adjacent areas 1944–53. Part 5, subsurface geology and engineering data) Refs.

Contains lithologic, paleontologic, logistic, and engineering information obtained in drilling these tests; data presented graphically. The tests were drilled in 1950 (Meade, 70°02′ N. 157°29′ W.) and 1951 (Kaolak, 69°56′ N. 160°15′ W.). Cretaceous rocks were tested in little-known areas; both tests penetrated beds of the Nanushuk group, early Cretaceous; underlying this group, a formation of marine shale called the Topagoruk formation, was found. Both wells were abandoned. Microfossils identified by H. R. Bergquist included Foraminifera of the Verneuilinoides borealis faunal zone, found extensively in northern Alaska; many core samples were barren. Correlation of the two wells on the basis of fossils cannot be made. ***Copy seen:*** DGS.

50307. COLLINS, FLORENCE RUCKER, *and* **H. R. BERGQUIST.** Test wells, Topagoruk area, Alaska, with micropaleontologic study of the Topagoruk test wells, northern Alaska. Washington, D.C., Govt. Exploration of Naval Petroleum Reserve no. 4 and adjacent areas, northern Alaska, 1944–53. Part 5, Subsurface geology and engineering data) 13 refs.

Fourth and final report on subsurface geology and engineering data of Naval Petroleum Reserve no. 4, test wells, similar in treatment to No. 47619, 50308, 54346. Presents detailed geologic and engineering data obtained, 1950–1951, in drilling two test wells in the Topagoruk area (approx. 70°35′ N. 155°30′ W.), much of the data recorded by Arctic Contractors for the U.S. Navy. Stratigraphy, cores and cuttings, heavy mineral analysis, core analyses, tests of oil and gas, logistics, and drilling operations are treated in detail. Notes on hole deviation and electric logging and other surveys are also given, for each well. The micropaleontologic study appended (p. 311–14) discusses numerous species of Foraminifera and a few ammonites obtained from the cores. ***Copy seen:*** DGS.

50308. COLLINS, FLORENCE RUCKER, *and others.* Test wells, Umiat area Alaska. Washington, D.C., U.S. Govt. Print. Off., 1958. p. iv, 71–206, illus., plates, 2 text maps, tables, 4 plates, diagr. (U.S. Geological Survey. Professional paper 305–B. Exploration of Naval Petroleum Reserve no. 4 and adjacent areas, northern Alaska, 1944–53. Part 5, Subsurface geology and engineering data) 5 refs. *Other authors:* H. R. Bergquist, M. C. Brewer, and G. L. Gates.

Presents detailed geologic and engineering data obtained in drilling 11 test wells at Umiat, northern Alaska, 1945–1952. Stratigraphy of the area reveals the age of the rocks as Cretaceous, overlain by unconsolidated Quaternary sediments. Each test well is described in detail, with lithologic remarks on cores and cuttings, on oil and gas shows, with heavy mineral studies, petrographic analyses, formation tests, and oil analysis. Information is summarized in graphic logs. Notes from drilling records are included, also a temperature survey prepared by M. C. Brewer. Microfossils are described by H. R. Bergquist. ***Copy seen:*** DGS.

50309. COLLINS, FLORENCE RUCKER. Vegetated sand dunes in central Alaska. (Geological Society of America. Bulletin, Dec. 1958. v. 69, no. 12, pt. 2, p. 1752.) Abstract of a paper presented at the Ninth Alaskan Science Conference at College, Sept. 3–5, 1958.

Describes sand dunes, northwest and

southeast of the Kuskokwim Mts. Individual dunes average 40 ft. in height, and have crests from a few hundred ft. to several mi. in length. They are permafrost-free and support aspen or birch. The sand is overlain by a thin blanket of loess, and consists mostly of fine-grained, well-rounded chert; it was probably transported northward by streams from Alaska Range glaciers and then blown southwest.

50310. COLLINS, HENRY BASCOM, 1899– . Archaeological investigations on Southampton and Walrus Islands, N.W.T. (Canada. National Museum. Annual report for the fiscal year 1955–56, *pub.* 1957. Bulletin no. 147, p. 22–61, 13 plates.) 13 refs.

Reports on the 1955 phase of author's field work at Native Point, Southampton Island. Excavations of the Sadlermiut Eskimo site, last occupied in 1902–1903, yielded a large number of artifacts; but no cultural differences were noticed between recent and older layers. The large proportion (60%) of seal bones at the early or proto-Dorset T–1 site, shows seal the principal food animal. The artifacts, predominantly stone implements (micro-blades) with bird-bone needles coming next, are described and figured on plates. The cultural affinities of T–1 with Dorset sites and with pre-Dorset flint complexes to the west (Cape Denbigh, Anaktuvuk, etc.) and its connections to the neolithic and mesolithic sites in Siberia and Mongolia (cf. No. 41687) are noted. Dorset features present and absent at T–1 are enumerated, a Carbon-14 dating of 2060±230 years obtained from some charred bone samples is noted: the site's classification as formative or proto-Dorset is considered. Diggings were also conducted at the T–3 and T–2 sites. T–3 yielded micro-blades, harpoon heads, etc. of the same type as T–1, while T–2 showed highly characteristic Dorset traits (more advanced than those of T–1 or T–3), similar to the late Dorset site on Mill Island (No. 31052). The exploration of the granite boulder houses (six) on Walrus Island produced stone, bone and ivory artifacts, predominantly Dorset, and a few Sadlermiut articles. A secondary Sadlermiut occupation of this originally Dorset site is suggested.

50311. COLLINS, HENRY BASCOM, 1899– . Archeological work in arctic Canada. (Smithsonian Institution. Annual report, 1956, *pub.* 1957, p. 509–528, illus., table, map.) 20 refs.

Describes author's 1954 and 1955 expeditions to Southampton Island and exploratory trips to Bencas, Coats and Walrus Islands (cf. No. 44424–44426). Two (out of 75) Sadlermiut sod-block and stone houses at Native Point, three near-by Dorset sites (T–1, –2, –3) and six granite-block houses on Walrus Island were excavated. First believed to be of Sadlermiut origin, these latter yielded predominantly typical Dorset stone artifacts. The distribution of the material indicated an originally Dorset occupation, the houses having been taken over by the Sadlermiut probably at the turn of the present century. This site provides the first adequate information on Dorset house types, and it confirms author's opinion on the Dorset origin of the Sadlermiut Eskimos: two of the houses are of cloverleaf shape characteristic for many Sadlermiut structures. The Native Point and Walrus Island finds give a continuous picture of the formation and development of Dorset culture, from the proto-Dorset site T–1, through T–3 to the classic T–2, and finally the Dorset-derived Sadlermiut culture. Photographs of the sites and finds are reproduced on 14 plates. Animal bones found at Native Point are described and the number and percentage of the identifiable mammal bones tabulated for the T–1 and Sadlermiut sites.

50312. COLLINS, HENRY BASCOM, 1899– . Eskimo origins. (Archaeology, Sept. 1958. v. 11, no. 3, p. 217–18.)

An interview with Dr. H. B. Collins on the origin of the Eskimos. The microlithic artifacts found in Eskimo and pre-Eskimo sites of the American Arctic can be traced to the late mesolithic or early neolithic of Europe and Asia. The Lake Baykal and upper Lena River region are considered the most likely homeland of the Eskimo ancestors.

Discussion of the natural division of the genus and its geographic distribution is followed by a systematic treatment, key, description of 11 species, with synonyms,

critical notes and lists of representative specimens. Included are *Osmorhiza purpurea* (type locality Sitka, Alaska), *O. chilensis* (Alaska and Aleutian Islands), and *O. obtusa* (Labrador, Newfoundland and Alaska). ***Copy seen:*** DLC.

50320. ***CONTRACTORS AND ENGINEERS.*** Arctic shelter of fir plywood adopted for use by U.S. Army. (Contractors and engineers, Oct. 1957. v. 54, no. 10, p. 61, illus.)

The building developed by the U.S. Army Corps of Engineers' Research and Development Laboratories has been adopted for use as barracks and communications centers following successful tests at Fort Churchill and Fort Greely. The 20 x 48-ft. structure consists of 3-inch-thick stressed-covered panels with fir plywood surfaces glued to the wood edge bonding and interior framing. The void between members is filled with aluminum foil lining and fiberglass. The building, capable of withstanding 100 mph winds and snow loads of 75 lb./sq. ft., was erected in 65 man-hours at temperatures of −35° F. Illus. shows an erection crew at work.

Copy seen: DLC.

50321. ***CONTRACTORS AND ENGINEERS.*** Building of insulated panels withstands winter at mountaintop transmitting station. (Contractors and engineers, Oct. 1957. v. 54, no. 10, p. 53, illus.)

A specially-designed building of panel construction to withstand extremely high winds and temperatures to −50° F. is described briefly. The building to be used as a transmitter studio atop Mt. Washington (New Hampshire) consists of fir plywood stressed-skin sandwich panels, insulated and cushioned against maximum impact, and bolted to a steel frame and permanent concrete piers. The roof panels are faced with heavy tar and gravel, underlaid with five layers of felt. A cushion sandwich panel beneath contains fiberglass insulation. Wall panels are similar in construction. Floor panels, though similar, were designed to handle 60 lb./sq. ft. in most of the building. ***Copy seen:*** DLC.

50322. ***CONTRACTORS AND ENGINEERS.*** Building's tarp coat protects work and men through winter job. (Contractors and engineers, Oct. 1957. v. 54, no. 10, p. 78–82, illus.)

Illustrates the use of large canvas enclosures to permit winter construction. All steel for the building, located in downtown Chicago, had been erected by Nov. 1956, so it was decided to continue through the winter months with concreting and plastering. As many as five floors were canvassed off at a time. Oil heaters and propane pots were employed to maintain temperatures at about 70° F. even with outside temperatures below zero. Enough natural ventilation was present to keep CO levels below the allowable limit. ***Copy seen:*** DLC.

50323. ***CONTRACTORS AND ENGINEERS.*** Cold-weather technique removes asphalt from drums in less than one minute. (Contractors and engineers, Oct. 1957. v. 54, no. 10, p. 58–60, illus., diagrs.)

An efficient method is described for removing solidified asphalt from 55-gallon metal drums which was developed during construction of the U.S. Air Force Base at Thule, Greenland. Tops of the drums were removed with a small air hammer. A vent was placed in the other end to prevent air lock. An induction coil supplied by a 50-kw. generator was lowered over the inverted drum of asphalt and electric current used to melt the asphalt free from the drum. Details of the equipment are diagrammed and illustrated. ***Copy seen:*** DLC.

50324. ***CONTRACTORS AND ENGINEERS.*** Corps studies excavating frozen grounds in Arctic. (Contractors and engineers, Oct. 1957. v. 54, no. 10, p. 64.)

A commercially-developed truck-mounted earth auger has been undergoing laboratory tests at the U.S. Army Corps of Engineers' Research and Development Laboratories to determine its possible use in excavating frozen ground in the Arctic. A 4 x 4 x 7-ft. test block of silt and sandy loam frozen for four days at −55° F. was used in the initial experiments. The auger, operating on the centrifugal force principle, experienced difficulty in discharging the spoil.

50328. COOK, JERRY. Building base camps for DEW Line, a saga of arctic construction. (Roads and engineering construction, Apr. 1956. v. 94, no. 4, p. 53, 166, illus.)

Describes a 600-mile hauling operation from Barter Island along the North Alaska coast. Construction equipment to build radar stations was delivered at seven selected sites along the coast, by a tractor train made up of 45 sleds, nine tractors and 19 men. At each site in turn, a 200 by 4,500–8,000 ft. air strip was cleared for reception of C–124's and C–46's with heavy equipment and supplies. The hauling operation was completed in 22 days (Mar. 28–Apr. 20), 17 of them in travel; the tractors averaged 40 mi./day pulling five sleds. Terrain (rough) and special adaptation of the tractors for the trip are indicated. ***Copy seen:*** DLC.

50333. COONRAD, WARREN L. Geologic reconnaissance in the Yukon-Kuskokwim delta region, Alaska. Washington, D.C., 1957. Map sheet with text, 29 x 29 in. (U.S. Geological Survey. Miscellaneous geologic investigations. Map I-223). 23 refs.

Map (1:500,000) covers about 21,000 sq. mi. in the Yukon-Kuskokwim delta west of Bethel, including Nelson and Nunivak Islands. Extent of five types of deposits, and other geologic features are designated. Based on reconnaissance field study in 1954, later data and interpretation of vertical aerial photographs. Brief remarks on general geology are followed by description of the deposits, predominantly deltaic and aeolian. Traces of folding and faulting are noted. Mineral resources of economic interest were not found, though thin coal beds are present at several places. Petroleum deposits in areas of probable Cretaceous rocks are a possibility. Ground water supplies from deep wells, below perennially frozen ground, are probably widely available. ***Copy seen:*** DGS.

50339. CORBEL, JEAN, 1920– . Aspects régionaux de l'Inlandsis Groenlandais. (Norois, July–Sept. 1958. année 5, no. 19, p. 241–66, 8 text maps, 4 diagrs., table) 59 refs. Text in French. ***Title tr.:*** Regional aspects of the Greenland Inland Ice.

Compares glacial features of the northern and southern parts of the inland ice, geological features underlying the ice, also distribution of snow, total precipitation and temperature. The area is not homogeneous, but contains two distinct ice domes: joined but geologically different, the southern more active and in a state of equilibrium, the ice 3,500 m. at center; the northern 2,500 m. thick, stagnant and fossil. Two great ice rivers, Jakobshavns Isbrae and Rinks Isbrae, reach the west coast. Glaciers in the south move at 10 km./year, in the north at 10 m./year. Differences in precipitation: more snow in the east (with maximum in winter) than the west (with a summer max.), also in geology, and in state of ice in north and south are discussed. ***Copy seen:*** DGS.

50340. CORBEL, JEAN, 1920– . Climats et morphologie dans la Cordillère canadienne. (Revue canadienne de géographie, Jan.–June, 1958. v. 12, nos. 1–2, p. 14–45, 2 text maps, 7 diagrs.) Refs. Text in French. ***Title tr.:*** Climates and morphology in the Canadian Cordillera.

An essay in climatic geomorphology, considering the effect of climate on the land surface, and on the rate of erosion on different rocks. Includes discussion of the northern eastern Rocky Mts., and northern Middle Rockies. Erosion appears to be less in dry regions, such as the eastern border of the Rocky Mts.; it increases with precipitation such as occurs at higher levels in the Yukon. The rate and amount of erosion is affected by climate as well as by the character of the rocks. ***Copy seen:*** DGS.

50341. CORBEL, JEAN, 1920– . Esquimaux d'Amérique du Nord; deux cas d'évolution récente de groupements esquimaux. (Revue de géographie de Lyon, 1957. v. 32, no. 4, p. 365–73, maps, graphs.) Text in French. ***Title tr.:*** Eskimos of North America; two cases of recent evolution of Eskimo groupings.

Discusses some effects of mass infiltration of the white race upon the economy of Eskimos of the Thule-Pond Inlet area, and the Belcher Islands-northern Quebec-Labrador region. Data are given on climatic and sea ice conditions, northern limits of nomadism (map), etc. The Eskimos' dependence on hunting for subsistence and trade is stressed, with selected statistics (1925–1955) for blue fox, and for seal and whale catches at Pond Inlet. The average monthly income from fur sales in 1947 and 1955–56 (graphed) ranged from 50 to 1,200 francs respectively (the Belchers), to 1,000 and 5,000 (Thule). In the Quebec area generally, this trade is threatened as hunting diminishes with rise of a handicraft industry, and as the Eskimos are absorbed into the labor force of mining developments, etc. The military aspect of the U.S. Air Force Base at Thule favors the natives' fur trade, but it, like white economic penetration, poses a threat to the Eskimos' indigenous culture. ***Copy seen:*** DGS.

50342. CORBEL, JEAN, 1920– . Les Esquimaux dans le grand nord americain. (Revue de géographie de Lyon, 1958. v. 33, no. 3, p. 219–59, plates, maps, graphs.) 30 refs. Text in French. ***Title tr.:*** The Eskimos in the American far North.

Considers the economic, cultural and political problems of Eskimos in some detail. Discusses their hostile physical environment and the importance of milder areas, "Rivieras," in Alaska and West Greenland. Population numbers and distribution are given. White administration in Greenland, Canada and Alaska; natural resources and employ-

ment opportunities; police, medical and educational facilities are treated in turn. Growth of urban centers is discussed with Aklavik, Chesterfield Inlet, Frobisher Bay and West Greenland towns as examples. The problem of adjustment to white civilization is not to be solved by assimilation, nor by return to the old way of life, but by the Eskimos themselves taking part in developing northern resources and at the same time preserving and developing their own language and culture. The possibility is foreseen of an Eskimo nation. ***Copy seen:*** DGS.

50343. CORBEL, JEAN, 1920– . Hydrologie et morphologie du nord-ouest americain. (Revue de géomorphologie dynamique, Aug.–Sept. 1957. année 8, No. 7–8, p. 97–112, 4 text maps, diagrs., graph.) 17 refs. Text in French. Summary in English. ***Title tr.:*** Hydrology and morphology of the American Northwest.

Area discussed includes Alaska, Mackenzie District, Yukon Territory, British Columbia and Alberta. It consists of a western snowy mountains zone in which run-off may exceed 25 ft. locally, and an interior dry zone with cold winters, warm summers. In the humid western zone, morphology is mainly controlled by erosion; in the dry northeast, structure is the controlling factor. Rock resistance varies according to climatic conditions: in the west, sandstones and granites form ridges and limestones the lowest points; the reverse is true in the northeast. Rates of erosion can be measured when the average solid content of the water and the total run-off are known. Three main limestone landscape types are found, depending on rates of erosion: *1*, typical karst features (large caves, dolines, potholes, etc.) in very cold wet snowy climates; *2*, small karstic features and some underground streams in cold inland climates; *3*, in dry arctic climates frost action predominates on surface and permafrost prevents development of important underground drainage. Erosion of siliceous rocks is also briefly discussed.—*From* English summary.

50344. CORBEL, JEAN, 1920– . Les karsts du nord-ouest de l'Europe et de quelques régions de comparaison; étude sur le rôle du climat dans l'erosion des calcaires. Lyon, 1957. 541 p. illus. incl. 100 photographs, text maps, diagrs., cross-sections, graphs, tables. (Lyon. Université. Institut des Études Rhodaniennes. Mémoires et documents 12.) 331 refs. Text in French. ***Title tr.:*** The karsts of northwest Europe and of some regions of comparison; study of the role of climate in the erosion of limestones.

Contains results of research during 1946–1956 between 42°–80° N. Purpose of the study was to present a detailed picture of karst regions of Svalbard and Lapland, until now almost unknown, and to deal more briefly with karsts of coastal northwest Europe; to acquire precise information about karstification under the arctic and temperate climates of these regions and to make comparisons with areas of different climates. Climatic and geologic factors relating to karst formation in northwest Europe are briefly discussed. Then follows detailed description of karsts of northern Vestspitsbergen and Nordaustlandet, southern Vestspitsbergen and Bjørnøya (p. 29–70); karst regions in northern Scandinavia and Finland (p. 71–239), including Tromsø, Sagelva (Salangen), Kvernmoen, Tysfjord, Sörfolda, Saltfjorden, Svartisen, Beiardalen. Southern Scandinavia, Iceland, Great Britain, Ireland, Belgium, northern Germany and Denmark are similarly treated, though in less detail. Comparisons are made briefly with Alpine regions. Author discusses karsts under glacial and periglacial conditions, in regions of temporarily frozen ground, in cool oceanic climates and warm climates. Morphological evolution of karst areas, deep and shallow forms, is considered. Karstification occurs most rapidly in cold, very humid climates of the Norwegian type. ***Copy seen:*** DGS.

50345. CORBEL, JEAN, 1920– . La neige dans les régions hautement polaires, Canada, Groenland, au delà du 80° latitude nord. (Revue de géographie alpine, 1958. t. 46, fasc. 2, p. 343–66, 5 illus., text map, 9 diagrs., table.) 17 refs. Text in French. ***Title tr.:*** Snow in the high polar regions, Canada, Greenland, beyond 80° N.

Parts of Axel Heiberg and Ellesmere Islands, and northernmost Greenland are considered, an area of approx. 250,000 sq. km., (100,000 sq. mi.). Topography and climate of the region are briefly described. Snowfall and total precipitation data, and detailed discussion of precipitation in winter and summer as recorded at Alert, Eureka and Thule, are given. Two main factors affect the

amount and character of snowfall and the disposition of the snow cover, viz: temperature and wind. Very low temperatures limit the amount of snowfall; a relation between temperature and shape and size of the crystals is suggested; wind deposits the snow very irregularly; some areas accumulating little or no snow and resultant meltwater; other areas have an abundance, despite the general dryness. Photos and diagrams illustrate the uneven snow cover. Wind-driven snow appears to have little erosive power. ***Copy seen:*** DGS.

Six pressor amines (levarterenol, epinephrine, phenylephrine, methoxamine, ephedrine, methamphetamine) and one cardiac glycoside-ouabain were tested as to their effect on normothermic and dogs cooled to 25°–23° C. Blood pressure, heart rate, and right ventricular contractile force in both groups were variously affected by these drugs. None of the drugs in the doses employed, produced increased incidence of cardiac arrhythmias at low body temperature.

Incidence of ventricular fibrillation due to hypothermia in dogs was reduced from 91% in 33 controls to 37% in 19 treated animals. The mode of action of this agent is discussed.

Copy seen: DNLM.

50361. COVINO, BENJAMIN G., *and* W. R. BEAVERS. Cardiovascular response to hypothermia; effect of cold acclimatization. (American journal of physiology, Oct. 1957. v. 191, no. 1, p. 153–56, tables.) 11 refs.

Dogs exposed continuously to subzero temperature were fully acclimatized after four weeks in the cold. They showed a significantly lower terminal rectal temperature than unexposed controls. Ventricular fibrillation amounted to 9% as compared to 96% in controls. After five days in a warm environment deacclimatization took place. ***Copy seen:*** DNLM.

50362. COVINO, BENJAMIN G., *and* W. R. BEAVERS. Cardiovascular response to hypothermia; effect of cold acclimatization. Ladd Air Force Base, Jan. 1958. 15 p. illus., table. (U.S. Air Force. Arctic Aeromedical Laboratory. Technical report 57–27.) 12 refs.

Experimental study aimed at elucidating the effect of cold acclimation on the cardiac response to severe, acute hypothermia. Dogs, exposed one to four wks. to an ambient temperature of 0° to −40° C. showed, when made hypothermic, an incidence of 9% in ventricular fibrillation. Not-acclimatized controls showed an incidence of 96%. Extrinsic cardiac factors are claimed to be responsible for the difference. ***Copy seen:*** DNLM.

50363. COVINO, BENJAMIN G., *and* W. R. BEAVERS. Changes in cardiac contractility during immersion hypothermia. (American journal of physiology, Nov. 1958. v. 195, no. 2, p. 433–36, illus., table.) 11 refs.

A threefold increase in inotropic action of dog's heart was observed as rectal temperature fell to 25° C. Below this temperature, a gradual reduction in the amplitude of contraction took place. Isolated, perfused rabbit hearts showed similar increase in ventricular contraction when cooled. Results suggest a direct positive inotropic action of cold upon cardiac muscle.

Copy seen: DNLM.

50364. COVINO, BENJAMIN G., *and* W. R. BEAVERS. Effect of cold on the isolated and intact rabbit heart. (Journal of applied physiology, Nov. 1958. v. 13, no. 3, p. 422–24, illus.) 9 refs.

Neither the isolated nor the intact rabbit heart developed arrhythmias as temperature fell. In both instances, progressive bradycardia took place, with mechanical and electrical asystole appearing below 20° C. Hypothermic dogs, by contrast, showed high incidence of cardiac arrhythmias, indicating a true species difference. ***Copy seen:*** DNLM.

50365. COVINO, BENJAMIN G., *and* W. R. BEAVERS. Effect of hypothermia on ventricular fibrillary threshold. (Society for Experimental Biology and Medicine. Proceedings, Aug.–Sept. 1957. v. 95, no. 4, p. 631–34, illus., tables.) 12 refs.

Account of quantitative measurements of basic ventricular threshold and ventricular fibrillary threshold in dogs prior to and during immersion hypothermia. No change in basic threshold was seen when body temperature fell to 22° C., but ventricular fibrillary threshold showed at the same time a 5-fold decrease. Prior exposure to cold or maintenance of a steady pH did not alter this condition. ***Copy seen:*** DLC.

50366. COVINO, BENJAMIN G., *and* W. R. BEAVERS. Hind limb blood flow during immersion hypothermia. (Journal of applied physiology, Jan. 1957. v. 10, no. 1, p. 146–50, illus., table.) 20 refs.

Account of measurements of femoral arterial blood flow in dogs, prior to, and during immersion hypothermia. Rise in vasodilatation and blood flow was observed at 35° and at 28°–25° C. rectal temperature. In the first instance sympathetic cholinergic vasodilator fibers proved responsible for the vascular response; the second, unrelated to nervous or local metabolic factors, seemed to be a cold-induced reaction.

Copy seen: DNLM.

50367. COVINO, BENJAMIN G., *and* W. R. BEAVERS. Hind limb blood flow during immersion hypothermia. Jan. 1957. 13 p. illus., table. (U.S. Air Force. Arctic Aeromedical Laboratory, Ladd Air Force Base Alaska. Project no. 8–7954. Report no. 2.) 20 refs.

Two phases of vasodilatation were observed in the cooled hind limbs of dogs: one at a rectal temperature of 35° C., the other at 28–25° C. The first was due to stimulation of sympathetic dilator fibers of the arterio-venous anastomotic vessels in the skeletal muscle and could be inhibited by atropinization and/or sympathectomy-adrenalectomy. The second dilatation was unrelated to nervous or local metabolic factors and is assumed to be a direct result of cold on the arteriolar-capillary circuit. ***Copy seen:*** DNLM.

Revised and edited from Cranswick's M.A. thesis at Univ. of Toronto; complete thesis includes a discussion of the stratigraphy and other pertinent details; available at Dept. of Geological Sciences, Univ. of Toronto. Most of the material described was collected by Fritz in 1950 from the vicinity of Sextant (50°10′ N. 81°38′ W.) and Coral Rapids (50°12′ N. 81°40′ W.) in Northern Ontario. Cranswick visited the area later and added further specimens. "Twenty-eight species are described, of which three are new and two represent hitherto unrecognized varieties. Twelve species belong to the Tetra coralla and sixteen to the Tabulata. The fauna, which is considered to be of Middle Devonian age, is correlated with the 'Columbus' of Ontario . . . and central Ohio, and with the 'Jeffersonville' of southeastern Indiana."—Author's abstract. ***Copy seen:*** DGS.

50373. CRARY, ALBERT PADDOCK, 1911–. Arctic ice island and ice shelf studies, part 1. (Arctic, 1958. v. 11, no. 1, p. 3–42, illus., maps, diagrs., graphs, tables, profiles incl. fold.) 12 refs.

Summarizes some physical characteristics of ice island T–3 and its presumed source, the ice shelf off northern Ellesmere. Investigations since 1952 are described, results tabulated and graphed. The maximum ice thickness of the ice shelf was 60 m. and that of T–3, 68 m. (averaging 0.905 gm./cc. in density from the surface to a depth of 16 m.). Dust from dirt layers (collecting in small holes) on T–1 and T–3 appears to have originated from a land mass underlain partly by volcanic rock and partly by metamorphic and plutonic types and to have been wind-deposited. Deep cores on T–3 revealed a sequence of dirt layers to 28 m. with clear ice below, the composition and grain size the same in all the layers; the heaviest were near the surface (amounting to 114–122 gm./sq. m.) and at depths of 25 and 28 m. (80 gm./sq. m.). Four types of ice were observed on Ellesmere

ice shelf and on T–3 in 1953 and 1954: iced firn, glacier, lake and sea ice; in 1955 only iced firn and lake ice were identified on the island. Temperatures recorded below the depth of annual change at the ice rise near Ward Hunt Island were −17.7° C. at 12.2 m. and −17.3° C. at 18.0 m. Rocks, and plant and animal specimens found on T–3 are examined in relation to the possible origin of the island. Strand cracks at the junction between floating and grounded ice on the Ward Hunt ice shelf are also considered.—From SIPRE. ***Copy seen:*** DLC.

50374. CRARY, ALBERT PADDOCK, 1911– , *and* N. GOLDSTEIN. Geophysical studies in the Arctic Ocean. (Deep sea research, 1957. v. 4, no. 3, p. 185–201, 25 figs., table.) 7 refs.

Contains further results of studies made on ice island T–3 (drifting station B), occupied Mar. 1952–May 1954, Apr.–Sept. 1955 (No. 34260). During these periods, T–3 drifted generally southeastward in an irregular path from 88° N. 156° W. to 82°19′ N. 98° W. Personnel from U.S. Air Force Cambridge Research Center carried on geophysical studies throughout the occupation, except Oct. 1953–Mar. 1954. A prominent submarine ridge was discovered which rises in one area to 1,450 m. below the sea surface; it lies southwest of and parallel to the Lomonosov Range; appears to be nearly as high, but not as extensive; it is tentatively named "Marvin Ridge" after a member of Peary's 1909 North Pole trip. Seismic reflection data were used to determine water depths, character and thickness of bottom sediments. Gravity studies revealed that the vertical motion of T–3 was considerably greater than that experienced on land areas. Comparison was made with gravity values at Thule; results from both places need further confirmation. ***Copy seen:*** DGS.

Description of three cases in adults, 16, 47, and 67 years old. Bleeding and hemorrhagic tendencies were the most common symptoms; alopecia, anorexia and malaise, less so. Withdrawal of vitamin A intake made these toxic effects disappear. ***Copy seen:*** DNLM.

50377. CREMER, B., *and others.* Oxygen uptake of tissue and disappearance of shivering activity. (Federation proceedings, Mar. 1958. v. 17, no. 1, pt. 1, p. 31.) *Other authors:* D. Johnston, T. Davis, F. Bell, and R. Jasper.

Summary of experiments with rats exposed to 5–6° C. Shivering showed a decline as exposure increased in length; it varied inversely with O_2-uptake of muscle tissue during 10–21 days exposure and directly during the 21–30-day period. Liver tissue showed no change in O_2-consumption during cold exposure.

50386. CROCKER, C. R. Winter construction. (Engineering journal, Feb.

1958. v. 41, no. 2, p. 43–49, illus., graphs.) 7 refs.

Steps to encourage winter activity in the Canadian construction industry are described. Construction techniques in Scandinavia and Russia are examined, and details of a system of state control in Sweden are given. Prefabricated concrete walls, floor and roof panels are widely used. A Russian cold concreting technique which permits placing of concrete at below-zero temperatures without protection, and a system of heating concrete on large hydraulic structures by electricity, are described.

Copy seen: DLC.

50387. CROCKER, C. R. Winter construction; problems and progress. (Engineering and contract record, Oct. 1957. v. 70, no. 10, p. 86–89.)

Economic problems resulting from seasonal unemployment in the construction industry in Canada are briefly outlined, and measures adopted in Scandinavia, Russia, and Canada to extend the construction season are described. In Norway and Sweden, the government attempts to stabilize employment by a system of permits which controls building activity. Cold concrete has been used in the U.S.S.R. since 1952, and new techniques of winter concreting have been developed. Prefabrication is also widely used. Canada leads in per capita volume of winter work, and several examples of winter construction are cited to show it is possible at an acceptable cost.

50395. CROSS, GEORGE C. Yukon 1956 review. (Canadian mining journal, Feb. 1957. v. 78, no. 2, p. 93–94, text map.)

Mineral developments and production in the area are reviewed, with major prospecting and development sites shown on map. Production generally increased over the previous year. The next major increase in mineral production in the area is apparently dependent on road, rail, power, and smelting development. On Galena Hill, all known major surface showings and contacts have been mapped in the area between Elsa and Calumet camps, leaving only the Silver King area to be mapped. On Keno Hill, plane table mapping during the summer extended the mapped area to include the Lucky Queen and Wernecke areas.

Copy seen: DLC.

50396. CROSS, GEORGE C. Yukon 1957 review. (Canadian mining journal, Feb. 1958. v. 79, no. 2, p. 104–105, map.)

Oil exploration in 1956–57 is stressed: ten million acres covered by permit applications by Sept. 1957; a test well drilled; group effort, use of aircraft, and experience of geologists are noted. Gold, lead and zinc prices declined, but production continued satisfactory. Active exploration for asbestos is underway. Map locates 18 active or inactive mines, and areas under exploration.

Text in Russian. *Other authors:* S. A. Stanko, G. S. Gorbunova, and Z. S Igumnova. ***Title tr.:*** Light assimilation by plants at Yakutsk and Tiksi.

Reports an experimental study of optical properties of plants (radish) carried out in Yakutsk (62° N.) and in Tiksi (71.6° N.). The weather conditions in both places are tabulated. The conclusion is offered that the Yakutsk plants reflect and pass more solar rays than the Tiksi plants; the latter, however, absorb light much more effectively than the same species in Yakutsk, i.e., 90 percent, as graphically

shown. The significance of northern plants utilizing light energy better than more southerly ones is noted. This confirms a theory advanced by K. A. Timirîazev long ago on the "optical adaptation" of plants, compensating thus the lack of radiant heat in the Arctic. The output of dry matter in the plants was also studied; the output (tabulated) was one-and-a-half times larger in Tiksi than in Yakutsk. ***Copy seen:*** DLC.

50415. DAHL, EILIF, 1916– . Amfiatlantiske planter. (Blyttia, 1958. bd. 16, hefte 3, p. 93–121, 6 text maps, 5 tables.) 48 refs. Text in Norwegian. Summary in English. ***Title tr.:*** Amphi-Atlantic plants.

The hypothesis that the amphi-Atlantic species once came from the Bering Strait area, and subsequently died out in adjacent parts of America and Eurasia is considered (and rejected). Another hypothesis involves migration across the Atlantic either by means of long-distance dispersal or by a land bridge between Europe and America. If the arctic species in Scandinavia and the eastern species in Greenland crossed the Atlantic by dispersal, one would expect to find species adapted to long-distance dispersal highly represented within these elements. All these hypotheses are represented in the tabular survey. The discussion covers practically all northern regions of Europe, Asia and North America.

50416. DAHL, KNUT, 1871– . The scales of the herring as a means of determining age, growth and migration. Bergen, J. Grieg, 1907. 36 p. illus., tables. (Norway. Fiskeridirektoratet. Skrifter, ser. havundersøkelser. Report on Norwegian fishery and marine investigations, v. 2, no. 6.) Refs. in text.

A study of scales of herring from Norwegian and other waters with the ultimate aim of determining the existence of different types or "tribes." Following a fundamental section on the structure of scales at different seasons and their growth and growth rings, herrings from various seas are analyzed for their length, age and scales. The Norwegian spring herring was found to attain the largest size due to continuous growth, whilst the growth of other types becomes arrested; the types inhabiting the ocean consist of older, large, individuals, those in the fjords or bays are younger and smaller. The scales of all these different types were found to grow differently, so that in some cases the type can be determined from a single scale. The significance of this observation is discussed. ***Copy seen:*** DI.

Comment on views of Gunnar Carlborg (q.v.): exchange of farm wood lots in Norrbotten is more essential than lot-exchange between the state and lumber companies and should be made part of this program. ***Copy seen:*** DA.

50419. DAHLSKOG, STEN. Dagbok från Kvikkjokk. (Sveriges natur. Årsbok, 1957. årg 48, nr. 4A, p. 91–106, illus.) Text in Swedish. ***Title tr.:*** Journal from Kvikkjokk.

The local limit of navigation on the Lilla Lule River was the factor responsible for the location of Kvikkjokk. But the delta of two mountain streams, which enter quiet water at the site, has been the determining factor in development of the area. The role of almost annual floods in extending the delta and in fertilizing and flooding its topsoil is discussed. The future of the region depends on how highways and waterpower are developed, and the hydroelectric power project is a controversial issue; it is considered by the local population as potentially harmful for the welfare of the region. ***Copy seen:*** DLC.

Contains results of investigations over several years in a small tarn a few km. south of Abisko (68°20′ N. 18°51′ E.) in northern Sweden. The study deals mainly with infection of the fish by *Ligula intestinalis* L. A biological account of this cestode's development and its effect on the host is given. Of 232 fish examined, 38% (56% of the males, 26% of the females) were affected. Infection appears earliest in some three-year-olds; the incidence increases with age and practically all the oldest specimens contain parasites. Possible nutritional causes for the greater infection of males than females and for the absence of infection in the young are discussed.

Monographic study of forced labor and the so-called Corrective Labor Camps (Ispravitel'no-trudovye lagerîa) in the U.S.S.R., based in part on unpublished materials and data supplied by escapees. Of 125 camps listed with note of activities in 1947, 35 are in the arctic or subarctic regions (maps p. 64–65). Development of gold mining in the Kolyma and Indigirka basins and in Chukotka, the foundation of Magadan and construction of the Magadan-Seymchan highway with forced labor, the organization of Dal'stroĭ and its activities, treatment of the laborers, their mortality (high) are recounted (p. 108–148). The gold output is tentatively estimated at 11 to 16 million oz. annually. The camp of prisoners and deportees in the Solovetskiye Islands in 1921–25 is described (p. 168–85), and scattered information offered on other northern camps. A survey of the international literature is appended.

50450. DAVIES, DOUGLAS M., *and* **B. V. PETERSON.** Observations on the mating, feeding, ovarian development and oviposition of adult black flies, Simulidae, Diptera. (Canadian journal of zoology, Dec. 1956. v. 34, no. 6, p. 615–55, illus., tables.) 125 refs.

A study of 24 species, six from northern regions including some very common

forms, the others from southern Ontario. Notes on the taxonomy and ecology of the *Simulium venustum-S. verecundum* complex precede the account of the functions cited in title. The section on mating includes the main behavior. Feeding deals with structure of mouth parts, ways of blood sucking in the various species and feeding on nectar. Ovarian development includes number of gonotrophic cycles, variations in number and size of eggs, etc.; ways of oviposition are described for each species.

50451. DAVIES, ELIZABETH W. Cytology, evolution and origin of the aneuploid series in the genus *Carex.* (Hereditas, 1956. bd. 42, häft, 3–4, p. 349–65, 36 illus., 2 tables.) 75 refs.

Contains a detailed cytological survey of the sedge genus *Carex:* 23 species with haploid chromosome numbers are tabulated, among them *C. lachenalii* from Abisko, Torne Lappmark (n=29). Conclusions reached are as follows: "Aneuploidy is the major process in the evolution of *Carex,* and the diffuse nature of the centromere accounts for the long aneuploid series present in this genus. The chromosomes of the Cyperaceae, like the Juncaceae, break and the fragments remain viable and function as separate entities. Thus, the series is ascending, and like polyploidy, aneuploidy in the form of agmatoploidy, produces variation in plants and speciation."

50452. DAVIES, J. L. The geography of the gray seal. (Journal of mammalogy, Aug. 1957. v. 38, no. 3, p. 297–310, tables, maps.) 45 refs.

A survey of the distribution of *Halichoerus grypus* (Fabricius) and biological factors affecting it. Three population groups, totalling some 50 thousand head, were found to exist: one in the Gulf of St. Lawrence; a second in the British Isles, Faeroes, Iceland, Norway and the White Sea region; a third in the Baltic. The three groups are isolated from each other not only geographically but also physiologically and in behavior, development and morphology. The movement of the seals within each group is mainly connected with feeding and breeding.

50453. DAVIES, J. L., *and* **E. R. GUILER.** A newborn piked whale in Tasmania. (Journal of mammalogy, Nov. 1958. v. 39, no. 4, p. 593–94.) 8 refs.

Description of a fetal or newborn specimen of *Balaenoptera acutorostrata* Lacépède, 216 cm. long, with data on morphometry, anatomy, color. This is the first authentic record of this species for Tasmania. Its condition suggests that the young of this form are born in June or July. ***Copy seen:*** DI.

50454. DAVIES, J. L. The Pinnipedia; an essay in zoogeography. (Geographical review, Oct. 1958. v. 48, no. 4, p. 474–93, maps.) 28 refs.

Presents evidence from a variety of sources, indicating the cold water, specifically arctic, origin of these mammals. Supplementing this with geological evidence, a middle or late Eocene Arctic Sea is assumed most likely to have been the area of their early development and appearance. Sea lions, walrus, and several seals are considered in turn. Their subsequent spread through all the cold seas and further development are reconstructed and their present regional geography outlined. ***Copy seen:*** DLC.

50455. DAVIES, J. L. Pleistocene geography and the distribution of northern pinnipeds. (Ecology, Jan. 1958. v. 39, no. 1, p. 97–113, illus., table, maps.) 24 refs.

An attempt to explain present-day distribution of these pinnipeds (seals, sea lion, walrus) by happenings during the Pleistocene, specifically, by the periodic expansion and contraction of the polar sea and glacier ice. Expansion of the ice caused splitting and isolation of seal populations and formation of new forms, etc. Contraction acted in an opposite sense. The last two glacial ages, but especially the last one are considered responsible for the present distribution of seals.

Copy seen: DLC.

50456. DAVIS, G. C. A monograph of the tribe Bassini. (American Entomological Society. Transactions, 1895. v. 22, p. 17–30.)

Contains a systematic annotated list of 29 species of these hymenopters, including *Zootrephes frigidus* from the Hudson Bay region. ***Copy seen:*** DA.

50457. DAVIS, M. M. Frost damage to roads; certain design characteristics

help control the harmful effects of frost action. (Engineering and contract record, Oct. 1957. v. 70, no. 10, p. 108–111, illus.)

Techniques for controlling the harmful effects of frost action on roads are reviewed. The process of freezing in various soils and procedures for determining their frost-susceptibility are outlined. Control measures include proper drainage, the removal of frost-susceptible soil layers, the installation of granular wedges adjacent to fixed drainage structures, the use of frost-resistant materials for base courses, and frost-proofing of susceptible soils. Diagrams are presented showing uniform and differential heaving and thawing as well as the types of ice formation in various soils.—From SIPRE.

Copy seen: DLC.

50458. DAVIS, M. M. Highway design and frost-susceptible soils. (Roads and engineering construction, Sept. 1957. v. 95, no. 9, p. 98+.) 5 refs.

Contains a general outline of procedures to control damaging effects of frost action on roads. Soil exploration to determine the degree of frost susceptibility before construction is stressed, and some simple preventative measures noted: proper drainage, removal of the frost-susceptible soil, placement of granular wedges adjacent to fixed structures, etc. Where frost-susceptible soil cannot be eliminated from the road construction, it should be kept four ft. below the final grade.

50460. DAVIS, T. NEIL, *and* **C. T. ELVEY.** Construction of an all-sky camera. (College, Alaska, Oct. 1955.) 43 p. incl 28 p. illus., diagrs. (Alaska. University. Geophysical Institute. Research report no. 2.)

Contains a detailed report on the construction of equipment employed at College and Point Barrow for recording stable or slowly moving auroral forms. The equipment consists essentially of a 16-mm. movie camera equipped for time-lapse photography which views the entire sky in a convex mirror. Several schematics showing construction details are included. ***Copy seen:*** CaMAI.

50461. DAVIS, T. NEIL. Preliminary report on the Alaskan earthquake of April 7, 1958. (American Geophysical Union. Transactions, Oct. 1958. v. 39, no. 5, p. 941–42, map.)

Reports field investigation of Apr. 10, in the region of the epicenter, fixed at 65°45′ N. 155°30′ W., near Huslia on the Koyukuk River. Severe breakage of lake and river ice (approx. 3 ft. thick at the time) and many ground cracks and mud flows were observed in a 3 x 35 mi. zone. The shock was of Richter magnitude 7.0–7.5; the area over which the main shock was felt with an intensity of V or greater on the Modified Mercalli scale is in excess of 100,000 sq. mi.

A study of the very rapid growth in these two sparrows which amounted to 40% per day and was completed with parallel development in seven–eight days. In the first two days of life, both species were never warmer than 3° above the environment (within an ambient temperature range of 15° to 38° C.). Both withstood body temperatures of 15° C. for one hour without harm. Temperature control improved gradually and became complete at the age of seven days.

50469. DAWSON, WILLIAM RYAN, 1927– . Relation of oxygen consumption and evaporative water loss to temperature in the cardinal. (Physiological zoology, Jan. 1958. v. 31, no. 1, p. 37–48, illus., table.) 31 refs.

A study made during the cold and warm season in a temperature range of −17° to 41.5° C. Thermal neutrality between late December and early April varied from 18° to 33° C. Below thermal neutrality O_2-consumption increased approximately 0.1 cc./gm./hr. for each degree of decrease in environmental temperature. Evaporative water loss was determined for late spring and early summer only.

50471. DEAN, WILLIAM GEORGE, 1921– . Human geography of the lower Albany River basin. (Geographical bulletin, 1957. no. 10, p. 55–75, illus., fold. map.) Summary in French.

Describes effects of the physical environment on the economic development, establishment of settlements and cultural patterns of this area (approx. 52° N. 83° W.) in Northern Ontario. The economy is mainly extractive, depending on furs, wood-pulp and timber. Development possibilities are limited. The Indians, who belong to the Albany band of the Crees, continue mostly to make their living from fur trading and retain much of their old culture. They are, however, in a stage of transition, and some of the younger ones are turning to other occupations and moving into the towns.

50472. DEANESLY, RUTH, *and* A. S. PARKES. Delayed development of grafts from frozen ovarian tissue. (Journal of endocrinology, Jan. 1957. v. 14, no. 4, p. xxxv–xxxvi.) 4 refs.

Rats receiving autografts of ovarian tissue frozen in glycerol-saline, glycerol-horse-serum or glycerol-egg-yolk and stored for one week or one month at −79° C. showed vaginal cornification in one to eight months after implantation, more than half of the grafts becoming active in over 12 weeks following implantation. The delay suggests severe damage by freezing, the oocytes being mostly affected, as subsequent microscopic examination showed.

50482. DEGERBØL, MAGNUS, 1895– . The extinct reindeer of East-Greenland, *Rangifer tarandus eogroenlandicus*, subsp. nov., compared with reindeer from other arctic regions. København, Ejnar Munksgaard, 1957. 79 p. illus., incl. 11 plates, map, diagrs., 12 tables. (Acta Arctica, fasc. 10.) 68 refs.

This reindeer died out about 1900, because of severe conditions, increasing attacks by wolves and finally some catastrophic winters. Skulls, skeletons, etc., indicate that it was small in size, about the same as *R.t. pearyi* and much smaller than the West Greenland reindeer *R.t. groenlandicus*. Like reindeer of other high arctic regions (*R.t. pearyi* and *R.t. platyrhynchus*), it tends to fairly short facial part and particularly protruding orbits. Special characteristics of the antlers are described. Only two skins are available: the coat is not so soft and fine, the skin not so soft and thin, and the winter coat not so pure white as in *R.t. pearyi*. It was present in northeast Greenland, but south of the Scoresbysund district, reindeer are found only in the Angmagssalik area. The Greenland mammalian fauna may be of American origin, having immigrated in post-glacial times. Before the subspecies *R.t. pearyi* was finally formed, American reindeer may have reached northwest Greenland, some going south, others to the north and east coasts. Since the effect of geographical isolation and natural selection is especially great in high arctic regions, there has been sufficient time for subspecific differentiation. ***Copy seen:*** DSI.

Comment on No. 54017: evidence of glacial movements discussed agrees with native tradition of Atna and Eyak-speaking Indians as told to this writer in 1952 and 1954, that Icy Bay and Yakutat Bay were once (before 1400) filled with ice; a village, established on Icy Bay following the ice recession of 1400, was overwhelmed by later advance of the Malaspina Glacier. ***Copy seen:*** DLC.

Presents a schematic map of the thickness of the earth's crust in the Arctic and outlines its geotectonic structures, evaluates recent pertinent literature and comments on studies by I. Oliver, M. Ewing, F. Press, P. Byerly and others. Geophysical and bathymetric data are used to reconstruct major landforms of the Arctic Basin. A hypothetical cross-section of the earth's crust from Novaya Zemlya toward Alaska is presented. Its friable, granitic, basaltic and subcrustal molded layers are reviewed, and their regional distribution discussed.

Copy seen: DGS.

50491. DEMENITSKAIA, R. M. Zavisimost' moshchnosti zemnoĭ kory ot vozrasta skladchatosti. (Sovetskai͡a geologii͡a, June 1958. god 1, no 6, p. 3–23, illus., tables, text maps.) 81 refs. Text in Russian. Summary in English. ***Title tr.:*** Dependence of the thickness of the earth's crust upon the age of folding.

Examines the principles presently used in dividing the earth's crust into continental and oceanic areas, and presents schematic maps of earth crustal thickness based on geotectonic mapping and on gravity, seismic and other data. The sharp differences indicated in crustal thickness in continental areas are believed to correspond to the age of folding, with young folding where maximal thickness exists, and ancient folding, the shields, in regions of minimum thickness. Lesser thicknesses characterize the areas of seas and oceans. Hence: "data on alteration of the crust thickness of the globe, and the uniformity in distribution of cardinal uplifts on the bottom of the world ocean lead to the conclusion of the unity and inversion of the process of development of the whole earth crust in space and time." The arctic regions are included in the discussion, and diagram of dispersion waves through the Arctic is presented. ***Copy seen:*** DLC.

50498. DEMUTH, HAL P. Tellurometer traverse surveys. Washington, D.C., 1958. 8 p. illus., 2 text maps. (U.S. Coast and Geodetic Survey. Technical bulletin no. 2.)

Contains brief description of the new instrument, designed to measure distances between two points by electronic methods, its two basic qualities: accuracy and portability. First model was received by the Coast and Geodetic Survey in June 1957. The instrument measures the time required for an energy pulse to travel from the master to the remote unit and return. This value is multiplied by a constant factor, the velocity of propagation, to obtain the distance. A measurement can be made in about 30 min. under normal weather conditions with trained operators. Results of two surveys, one in June 1957 on Atka Island in the Aleutians, are discussed. Field computations showed an accuracy of 1 in

18,830 over the total closed portion of the traverse of 77,226 m. The entire project, including establishment of 12 stations and closing the traverse, took a total of 14 working days.

50499. DENISOV, V. D. Promyslovye okhotnich'i khozîaĭstva. (Okhota i okhotnich'e khozîaĭstvo, Feb. 1958. god 4, no. 2, p. 3–5, illus., port., table.) Text in Russian. ***Title tr.:*** Commercial hunting farms.

In recent years, nine "promkhozes" (promyslovye khozîaĭstva), hunting farms or preserves, managed as governmental undertakings, like state farms, were organized in the R.S.F.S.R. In 1957, the Council of Ministers of the R.S.F.S.R. ordered 94 new promkhozes to be set up during 1958–60 in the taiga regions, raising their total number to 103. Data on their distribution are given (p. 3); three are in Arkhangel'sk Province, 11 in Tyumenskaya Oblast', 13 in Krasnoyarskiy Kray and six in Yakutia. Some 10,500 regular (*shtatnye*) trained hunters are to replace the 40–50 thousand seasonal hunters operating hitherto. The best hunting areas are to be assigned to promkhozes, each of which will be responsible for hunting industry output and for wildlife conservation in its reserve. Fur farming will be promoted and increased effectiveness is expected in hunting fur and game animals. Closer supervision and control are envisaged for the hunting and trapping activities of kolkhozes in Yakutia, Kamchatka and Magadan Province, and in other regions of the far North. ***Copy seen:*** DLC.

50511. DEPOCAS, FLORENT, 1923– , *and others.* Studies on glucose metabolism of warm and cold acclimated rats at −5° C. (Revue canadienne de biologie, Apr. 1957. v. 16, no. 1, p. 83–95, illus. table.) 13 refs. *Other authors:* G. K. MacLeod *and* J. S. Hart.

Account of exploratory experiments with animals injected uniformly labeled

C^{14}-glucose (U–C^{14}-glucose). Blood glucose, respiratory CO_2 and liver and muscle glycogen specific activities were subsequently measured at different times. The pattern of exhalation of $C^{14}O_2$ and the distribution of C^{14} in the carcass were also studied. "Certain consistent differences" between warm and cold acclimated rats, especially in exhalation of $C^{14}O_2$ were noted. ***Copy seen:*** DLC.

50512. DERBIKOV, I. V. Élementy tektoniki Uralo-Sibirskoĭ geosinklinal'noĭ oblasti. (Akademiîa nauk SSSR. Zapadno-Sibirskiĭ filial. Gornogeologicheskiĭ institut. Trudy, 1956, vyp. 15, p. 21–25, 2 fold. maps, cross-section.) 6 refs. Text in Russian. ***Title tr.:*** Elements of tectonics of the Ural-Siberian geosyncline zone.

Presents preliminary results on geological interpretation of tectonics of Pre-Mesozoic underlying strata based on geophysical, mainly aeromagnetic, survey recently carried out by the author and other scientists of the West Siberian geophysical trust. The scope of the survey is described. The Ural-Siberian folded zone was studied up to 62° N. Achieved results are presented on two maps, which include the entire arctic zone from the Ural in the west to the Lena in the east. The first map reviews the geology and geotectonics of the Ural-Siberian syncline, and the second, the axes of ridges and depressions of the Pre-Jurassic underlying. The text explains these maps. This preliminary presentation is said to change substantially the view hitherto held from previous investigations.

50513. DERBYSHIRE, EDWARD. Glacio-geomorphological research in the Howells valley and the watershed district of central Quebec-Labrador. (Arctic, 1958. v. 11, no. 3, p. 189–91.)

Discusses results of field studies during summer 1958. Well-developed subglacial drainage systems, evidence of marginal drainage down to present water-levels and the abundance of thick till deposits throughout the Howells valley (54°44′–55°18′ N.) are noted. The notion of a late-glacial lacustrine phase is dismissed in favor of occupation of the valley by a dwindling ice-mass. The same is true of neighboring valleys investigated. Well-developed drift tails throughout the western part of the area indicate final movement of ice from the south-southeast to north-northwest.

Copy seen: CaMAI.

50514. DERBYSHIRE, EDWARD. The identification and classification of glacial drainage channels from aerial photographs. (Geografiska annaler, 1958. årg. 40, häfte 3–4, p. 188–95.) 10 refs.

Discusses use of air photographs to identify and classify channels of fluvioglacial origin, its advantages and limitations. The form such channels assume on the ground is compared with their appearance on air photographs. The latter are required at comparatively large scale for positive recognition and classification; the scale 1 in. =1,000 ft., that of the Knob Lake area photos used in this study, is the minimum for detailed field and laboratory work of this nature. Three types of drainage channels can be recognized with some certainty on air photographs: lateral or "pro-glacial," subglacial chutes, and sublateral. Some indicators (11 characteristics of lateral drainage channels) are listed as those most reliable; but for positive identification field work is advised in doubtful cases.

50515. DERIŪGIN, KONSTANTIN MIKHAĬLOVICH, 1878–1938. Bentos èstuariîa r. Leny. (Leningrad. Gosudarstvennyĭ gidrologicheskiĭ institut. Issledovaniîa moreĭ SSSR, 1932. vyp. 15, p. 63–66, map.) Ref. Text in Russian. Summary in German. ***Title tr.:*** Benthos of the Lena estuary.

Report on the benthos collected by P. K. Khmyzhnikov at 12 stations whilst on an upstream journey in 1926. The material contained typical estuarine forms with some local elements. Temperature and salinity are also noted.

Copy seen: DLC.

50516. DERIŪGIN, KONSTANTIN MIKHAĬLOVICH, 1878–1938. Fauna Belogo moriîa i usloviîa ee sushchestvovaniîa. (Leningrad. Gosudarstvennyĭ gidrologicheskiĭ institut. Issledovaniîa moreĭ SSSR, 1928. vyp. 7–8, p. 1–511, illus., tables, maps.) Approx. 350 refs. Text in Russian. Summary in German (p. 446–80). ***Title tr.:*** Fauna of the White Sea and its life conditions.

A comprehensive biological and hydrographic study based largely on explorations conducted during 1922–1926 by the

State Hydrological Institute and the Institute for Exploration of the North with the *Murman*. Derîugin himself carried out the work with his colleagues and students. These investigations are outlined year by year (p. 10–34) with an introductory account (p. 1–9) of the topography and history of the White Sea. Results of the hydrological and biological investigations of 1922 and 1923 are presented (p. 35–89): temperature, chlorinity, salinity, etc., with depth; benthonic forms collected at stations, and depth and bottom character of them. Chap. 5 (p. 90–181) covers the hydrography of the White Sea: thermic conditions and salinity, oxygen and CO_2, pH, transparency, ice, currents. The bottom deposits are outlined (p. 182–97). An extensive treatment of the fauna (p. 198–362) reviews past faunistic research and continues with descriptions of the forms collected (in taxonomic order, from protozoans to mammals), including notes on occurrence, geographic distribution, taxonomic position, etc. The general characteristic of this fauna and its negative traits are outlined. Phyto- and zooplankton collected, its character, origin, etc. (p. 363–78), and the seaweeds (p. 379–82), are dealt with briefly. Zonation and ecological aspects, from the littoral down to the "pseudoabyssal" are discussed (p. 383–426). Quantitative aspects of the benthos are presented and zonation of the area is dealt with (p. 427–40) on the basis of the benthonic population. Finally the geographic origins of the studied fauna are considered, and an alphabetic list appended of the names of species and genera described, some 1,500 forms. ***Copy seen:*** DLC.

50517. DERÎUGIN, KONSTANTIN MIKHAÏLOVICH, 1878–1938. Gidrobiologicheskie issledovaniîa u Novoĭ Zemli. (Leningrad. Gosudarstvennyĭ gidrologicheskiĭ institut. Issledovaniîa moreĭ SSSR, 1927. vyp. 4, p. 5–16, map.) 2 refs. Text in Russian. Summary in German. ***Title tr.:*** Hydrobiological investigations at Novaya Zemlya.

Shallow waters (down to 25–30 m.) of Matochkin Shar and the southwest coast were studied during 1923–1926, chiefly temperature and salinity, to a lesser degree reaction, and gas content as well as tidal currents. In addition observations were made on ecological problems and such of ornithology, ichthyology, general geography, etc. The warm character of the west coast is noted together with the northward advancement of cod, etc.

50538. DIAMOND, MARVIN. Air temperature and precipitation on the Greenland Ice Cap. Wilmette, Ill., Oct. 1958. 9 p. 3 text maps, 6 tables. (U.S. Army. Corps of Engineers. Snow, Ice and Permafrost Research Establishment. Research report 43.) 17 refs.

"Mean annual air temperatures and precipitation on the Greenland Ice Cap, as estimated from snow profile studies and long-term meteorological records at coastal stations, have been used to prepare mean annual air temperature and mean annual precipitation charts for the Greenland Ice Cap. Melting of surface snow may occur at elevations of about 1,300 m. in North Greenland and up to 2,700 m. in South Greenland. The warming trend in the Arctic, as indicated by increases in mean annual air tem-

perature, may have occurred to a lesser extent on the ice cap than at sea-level coastal stations. Annual accumulation of precipitation is two or three times as great at 2,500 m. on the west side of the ice cap than at the crest. South of 66° N., precipitation may be about twice as great on the east side of the crest as on the west side." Data from two U.S. Air Force weather stations, Site 1 (1953–56) and Site 2 (1953–57); from Eismitte (1930–31), Station Centrale (1949–50) and from Northice (1952–54), and from six other ice-cap stations; from ten coastal stations, and from seven expeditions, were used.—From author's summary. ***Copy seen:*** CaMAI.

50539. DIAMOND, MARVIN, *and* **R. W. GERDEL.** Occurrence of blowing snow on the Greenland ice cap. Wilmette, Ill., Apr. 1957. 5 p., diagrs., tables. (*In:* U.S. Army. Corps of Engineers. Greenland ice cap research program, 1955–56, v. 2. SIPRE research report 25.) 2 refs.

Study of this phenomenon and its attendant restriction in visibility, based on U.S. Air Force data from Site 1 (July 20, 1953–Aug. 1954) and Site 2 (July 7, 1953–June 1956). Blowing snow occurs more than one-third of the time in this part of the icecap; most often in winter, least often in June-Aug., and commonly associated with winds of more than 20 knots. Periods of continuous blowing snow are usually less than 24 hrs. in duration, and nearly half less than 6 hrs. Relation between blowing snow and several meteorological elements is also discussed. ***Copy seen:*** CaMAI.

50540. DIAMOND, MARVIN. Precipitation trends in Greenland during the past thirty years. (Journal of glaciology, Mar. 1958. v. 3, no. 24, p. 177–80, diagrs.) 6 refs.

"The record of annual precipitation as obtained from stratigraphic studies on snow profiles in the interior of northern Greenland (200 miles east of Thule) made in 1954 by SIPRE personnel shows a decreasing precipitation trend since 1920 with the largest decrease occurring since 1932. A residual mass curve analysis of the data indicates that, in spite of large fluctuations in the accumulated precipitation, the decreasing trend may be considered valid over a period of several years."—Author's abstract. ***Copy seen:*** DGS.

50548. DIBNER, V. D., *and* **N. G. ZAGORSKAIÂ.** Konusoobraznye kholmy arkticheskikh tundr. (Priroda, Apr. 1958. t. 47, no. 4, p. 90–93, illus.) Ref. Text in Russian. ***Title tr.:*** Cone-shaped hills in the arctic tundras.

Describes such hills observed in Franz Joseph Land, Severnaya Zemlya, Svalbard, and other regions of contemporary glaciation. From 1.5–2.0 m. to 20–30 (occasionally–100) m. in height, they consist of broken rock, conglomerate and gravel. Their form, location, and origin are considered. Their formation is traced to fluvio-glacial action: the materials of which they are composed accumulate in the process of firn formation; later by migration and thawing of firn on lower slopes, the rock debris is distributed in conical mounds. Some similarities are noted between these hills and eskers. ***Copy seen:*** DLC.

50549. DIBNER, V. D. Novye dannye o geologicheskom stroenii ostrova Viktoriiâ. (*In:* Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Trudy, 1956. t. 89, Sbornik stateĭ po geologii Arktiki, vyp. 6, p. 59–60.) Text in Russian. ***Title tr.:*** New data on the geological structure of Viktoriya Island.

Gives the results of author's field investigation in summer 1953. The composition of dolomite rocks lying on the surface of Cape Klinovicha was studied and polished sections made. The organic forms are described. The age of these rocks is considered similar to that of the Vereya and Kashira series of the Russian platform, which belong to Middle Carboniferous. The geologic history and structure of Viktoriya Island is discussed. ***Copy seen:*** DLC.

50550. DIBNER, V. D. Novye dannye po stratigrafii mezozoĭskikh otlozheniĭ i geomorfologii severo-vostochnogo Taĭmyra. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Trudy, 1958. t. 80, Sbornik stateĭ po geologii Arktiki, vyp. 5, p. 15–22, illus., fold. map.) Text in Russian. ***Title tr.:*** New data on the stratigraphy of Mesozoic deposits and geomorphology of northeastern Taymyr.

Presents characteristics of types and forms of relief and stratigraphy of Mesozoic and Quaternary deposits in the Bikada-Nguoma River basin (approx. 74°50′–75°50′ N. 105°20′–110°05′ E.). The geologic structure and hydrographic net of the region are outlined. Lower and Upper Jurassic and Cretaceous deposits are reviewed and faunal characteristics given. Morphology of various structures is treated and summarized on map. ***Copy seen:*** DGS.

50551. DIBNER, V. D. Vozmozhnaiâ diapirovaiâ struktura v basseĭne reki Piâsiny. (Leningrad. Nauchno-issledovatel'skiĭ institut geologii Arktiki. Trudy, 1958. t. 80, Sbornik stateĭ po geologii Arktiki, vyp. 5, p. 134–38, maps.) Text in Russian. ***Title tr.:*** Possible diapir fold in the Pyasina River basin.

Describes a peculiar hillock, named Kruglyy, in the Pyra basin (approx. 71°45′–72°45′ N. 82°–86° E.), discovered by the author in an air-photo survey in 1952. Measurements of this hillock are given; its morphologic structure is described and magnetic anomalies characterized. The hillock is considered to be a diapir fold or, rather, a salt dome oil field. Further combined geologic and gravimetric study is urged.

50552. DIBROV, V. E. K geomorfologii i istorii oledeneniiâ severo-zapadnogo poberezh'iâ zaliva Shelekhova. (Akademiiâ nauk SSSR. Izvestiiâ, seriiâ geograficheskaiâ, Sept.–Oct. 1958, no 5, p. 35–41, illus., text map.) 4 refs. Text in Russian. ***Title tr.:*** Geomorphology and the history of glaciation on the northwest coast of Shelekhova Bay.

Reports on the region between the Nayakhan and Shirokaya Rivers (approx. 62° N. 157°–159° E.) on the Okhotsk Sea coast. The predominant Mesozoic volcanic and sedimentary rocks, mainly folded by alpine-type block faulting, are described; present orography of the region is outlined. The occurrences of glacial cirques in the Gydan Ridge and the interfluve between the Kolyma basin

and the Okhotsk, are described and considered as signs of former glaciation. Evidence is noted of two glaciations of the alpine type, and the glacial activity for final shaping of local relief is studied. The existence of independent centers of glaciation on the slope of the Okhotsk is confirmed, against opinions to the contrary: such centers existed on some of the highest peaks of Gydan Ridge.

Account of observations on vascular response and heat elimination in the finger immersed in cold (0° to 4° C.) water at various positions of the arm. A progressive decrease in heat elimination during the cold vasodilatation was observed as the finger was raised from 4 to 55 cm. above the sternal notch. The decreased heat elimination, paralleling the fall in blood flow, can be attributed to reduction in perfusion pressure as the arm is raised. ***Copy seen:*** DNLM.

50563. DI GIORGIO, A. M. Riflessi respiratori nella ipotermia; reazioni da termorecettori e da meccanorecettori trigeminali. (Archivio di fisiologia, 1957. v. 57, fasc. 2–3, p. 148–81, illus., tables.) 49 refs. Text in Italian. Summary in English. ***Title tr.:*** Respiratory reflexes in hypothermia; reaction of trigeminal thermo- and mechanoreceptors.

A study of conditions in guinea pigs, made hypothermic without narcosis. Critical extinction temperatures produced by mechanoreceptors were very different: 27° C. for sneeze and 20° for nostril expansion. Reflexes from thermoreceptors produced by water of different t° were elicited up to a body t° of about 24° C. At body temperatures lower than 24° first reactions to warmth disappear; reflexes to cold stimuli disappear at 22° C. (the head reflex), and at about 20° (the apnea). Temperature increase at the nerve centers did not produce reaction during hypothermia. Vagotomy did not change the critical temperature of the respiratory reflexes. Progressive extinction of the various reflexes appears to initiate the decrease in respiratory activity during hypothermia.

50568. DITTMAR, KURT. Infantry problems attendant to war in the far North. (Marine Corps gazette, Oct. 1958. v. 42, no. 10, p. 20–27, illus.)

Analyzes combat requirements, based on experiences during the 1941 German/Finnish offensive in Lapland. Selection of equipment and troop training are discussed, and the organization of a combat unit (brigade) is outlined. A relative increase in infantry troops is indispensable; training in mountain warfare and/or skiing experience essential. The rifleman is the basic element of the battle; tracked vehicles should replace heavy, motorized equipment to pull carts or sleds to the front line. Types of Finnish light sleds, horse- or man-drawn, are reviewed. ***Copy seen:*** DLC.

50569. DITTMAR, KURT. "Motti"; war in the far North. (Marine Corps gazette, Feb. 1957. v. 41, no. 2, p. 34–42, illus., maps, diagr.)

Describes and analyzes encounters between German/Finnish and Russian troops east of Kairala at about 66°50′ N. 30° E. in Aug. 1941. The Russians were routed by an enveloping surprise attack of infantry advancing through trackless forests in rain. Value of mobility (increased in winter) and air support is stressed. Small armoured groups may be employed; thick armour is more important than high speed.

Moskva, Gos. izd-vo geogr. lit-ry, 1956. 47 p. illus., map. 50 refs. Text in Russian. ***Title tr.:*** Toward the shores of America; voyages and explorations of M. S. Gvozdev, the first discoverer of Northwest America.

Biography of Mikhail Spiridonovich Gvozdev, geodesist with the Great Northern Expedition of 1725–1743, based in part on unpublished materials. Following note of his education (1716–27), his travels are recounted: the trip with I. Fedorov on the *Gavriil* in 1732 from Kamchatka to Bering Strait, discovery of the Diomede Islands, and the voyage

southward along the North American coast, regarded as the discovery of Northwest America (p. 20–28); exploration of Okhotsk Sea coasts and Shantarskiye Islands, etc. Rivalry among members of the expedition, Gvozdev's arrest and release, his geodetic work in Siberia, etc., are noted. A brief survey of earlier Russian attempts to reach North America is given (p. 5–9); and text of three documents relating to Gvozdev's activities (one signed by him) are appended. Map, p. 35, shows route of the *Gavriil* in 1732.

50587. DOHERTY, JAMES R. Top cover for America. . . . Alaskan Air Command. (Air force, Jan. 1958. v. 41, no. 1, p. 52–59, illus., map.)

Lists, with brief explanations, the location of U.S. Air Force bases throughout Alaska. A total of two air divisions, and nearly 100 aircraft control and warning stations, DEW Line sites, and White Alice (microwave communication system) installations are controlled from the Elmendorf headquarters. A survey is given of the various types of aircraft in use, and daily duties, operational readiness, flying conditions, and general living conditions are described. A photochart shows personnel of the Alaskan Air Command as of Nov. 20, 1957.

50588. DOLGIKH, BORIS OSIPOVICH. O nekotorykh ėtnogeneticheskikh profsessakh, pereseleniîakh narodov i rasprostranenii îazykov, v severnoĭ Sibiri. (Sovetskaîa ėtnografiîa, 1952, no. 1, p. 51–59.) 7 refs. Text in Russian. ***Title tr.:*** On some ethnogenetic processes, migration of peoples and diffusion of languages, in northern Siberia.

Discusses the ethnic and linguistic changes among the aboriginal population of Siberia between the 17th and 20th centuries, and suggests a relationship between the linguistic and economic-cultural advances: the expansion of the Samoyed languages seems related to the spread of reindeer herding; the Tungus languages follow the route of iron diffusion and reindeer riding. The methods of merging and assimilation (conquest, inter-

marriage, cultural-economic domination, etc.) are analyzed and exemplified. The language of a numerically and/or culturally superior group usually supplanted that of the smaller and/or less advanced tribe resulting either in a complete absorbtion (some Evenki clans migrating to Taymyr and merging with the local Nganasan-Samoyeds) or in the formation of new ethnic groups or sub-groups (the Dolgans of Taymyr Peninsula and reindeer-herding Yakuts of northern Yakutia being the result of the integration of Tungus and Yukaghir elements by Yakuts; the absorbtion of Asiatic Eskimos by Chukchis producing the coast-Chukchis). A more primitive group, however, could subjugate a more advanced people after acquiring their higher culture and economy: the Chukchis who took over reindeer herding from the Chuvantsy and Yukaghirs yet absorbed both groups. ***Copy seen:*** DLC.

50589. DOLGIKH, BORIS OSIPOVICH. Plemena Srednei Sibiri v xvii veke. (Akademiia nauk SSSR. Institut ėtnografii. Kratkie soobshcheniia, 1949. vyp. 8, p. 35–47, map, tables.) Text in Russian. ***Title tr.:*** The tribes of central Siberia in the 17th century.

A summary of reports delivered at the April and July 1948 sessions of the Siberian chapter of the Institute of Ethnography in Leningrad and Moscow. It describes the preliminary investigations connected with the preparation of an ethnographic map of Siberia for the second half of the 17th century and discusses the source material used: documents, fur tribute (iasak) registers, etc. The tables, compiled for the four central Siberian districts (uezd) i.e., Mangazeya, Yenisey, Ilim, and Krasnoyarsk, list the tribe and clan names, year used for statistics, number of tribute-paying and total population, and the tribal changes in these districts in the 19th century. The map, presented in a preliminary draft, shows the distribution of 17th century ethnic groups of central Siberia (52°–75° N. 80°–115° E.). Cf. Bakhrushin studies on this area, No. 43830.

50590. DOLGIKH, BORIS OSIPOVICH. Rodoplemennyi sostav narodov Sibiri v xvii veke. Moskva, Izd-vo Akademii nauk SSSR, 1956. 27 p. (Doklady sovetskoi delegatsii na v Mezhdunarodnom kongresse antropologov i ėtnografov.) Text in Russian and French. ***Title tr.:*** The tribal and clan composition of the peoples of Siberia in the 17th century. (Paper presented by the Soviet delegation at the Fifth International Congress of Anthropological and Ethnological Sciences.)

Reports on the new ethnographic map of the aboriginal population of Siberia (including peoples of the North) prior to the advent of the Russians. Research in source material, mainly tribute (iasak) lists, toponymics, folklore, etc., is discussed. The difficulties encountered in compiling and systematizing data are stressed, as due to incomplete documentation, application of the same tribal name to unrelated ethnic groups, use of clan names without indication of tribal affiliation by aboriginal sources including Tungus and Yukaghir, linguistic changes among territorially divided clans of the same tribe, etc. Comparison between native population in the 17th and 20th centuries shows a fluctuation in the ethnic and structural composition of tribes and clans, indicating that tribal and clan systems are subject to changes from internal development or external influence.

50591. DOLGIKH, BORIS OSIPOVICH. Tamgi nganasanov i ėntsev. (Akademiia nauk SSSR. Institut ėtnografii. Kratkie soobshcheniia, 1957. vyp. 27, p. 20–34, illus., table, graphs.) 6 refs. Text in Russian. ***Title tr.:*** Branding marks used by the Nganasans and Entsy.

Discusses the origin, branchings, interrelationship, etc., of Samoyed (Nganasan and Enets) families and clans on the basis of reindeer brand-marks, which were distinct and hereditary within each family. Used with little, if any, variation by all male descendants, the brands provide a clue for establishing the provenience of families or clans. Brands used since the 17th century are described and deduced findings on lineage presented. Most of the brand signs are of totemic origin; their use as signature is noted.

Refs. in text. Text in Russian. ***Title tr.:*** Twenty-five years' exploration of the free atmosphere in the Arctic.

Outline of the development of upper air observations in the Soviet Arctic, occasioned by the 25th anniversary of the first radiosonde release by its inventor P. A. Molchanov in Jan. 1931 at Aleksandrovsk (now Polyarnyy) in Kola Peninsula. The five aerological stations set up in 1932 increased to 21 by 1956; as a rule they release two radiosondes daily, during 1932–1956: over 72,000; the mean altitude on several stations is now 18–19 km. with maximum 30–31 km. Seven new arctic stations were established for IGY. Besides these permanent stations, vessels and drifting stations have been sending up radiosondes, and the vertical soundings are complemented by the flying observatories' horizontal soundings. Manuals, etc. for arctic observers are listed (p. 65), the main results of upper air observations in the Soviet Arctic are briefly discussed and plans for network development noted. Soviet aerology prior to the radiosonde is also briefly sketched.

In 1919, U.S.S.R. was divided into eleven time belts or zones numbered from 2 in the west (including Moscow) to 12 in the Far East (Chukotka), each zone being 15° wide and the boundaries coinciding as nearly as possible with the meridians. Many inconveniences of such theoretical zoning have appeared with the economic development of the country. A special interdepartmental commission of unified time service was created in 1947, which revised the zonal boundaries and adjusted them to geographic, administrative and economic requirements; meridional boundaries were left only in the Arctic and in sparsely inhabited areas of northern Asia. These new zonal divisions, which came into effect on Mar. 1, 1957, are shown on col. folded map.

Contains results of investigations made during Oxford University Expedition to Nordaustlandet in 1955. The region studied is a promontory on southwest Vestfonna, approx. 79°50′ N. 19° E., the surface composed of raised beach shingles, till and dolerite. Stone orientation measurements, raised beaches of Brageneset and neighboring parts of Hinlopenstretet, marine shells from the tills and raised beaches are reported and discussed. The Quaternary history of Brageneset is traced. The stone orientation measurements confirm the generally held view (long axes parallel to direction of ice movement), but this parallel orientation sometimes may be complicated by transverse direction, which in narrow-band tills, may even predominate. The beaches at Brageneset cannot be grouped into stages on the basis of morphology or marine shells, but two shore levels can be distinguished because of the pumice found on them, and a comparison made with the raised beaches on northern Hinlopenstretet. There is a tilt towards the northwest, the upper pumice level dropping from 13.8 m. at Brageneset to 3.0 at Mosselbukta (79°50′ N. 15°30′ E.). The uplift has been rapid, the higher pumice levels are probably about 500 years old. Quaternary events are distinguished as: an early ice advance and retreat, uplift, a second ice advance (probably between 1861 and 1899); ice from the end-moraines formed by the younger advance is in retreat at present.

Presents information assembled from geologists' reports, unpublished materials and author's studies during the Danish Expedition to East Greenland led by L. Koch. The principal outcrops of Jurassic and Cretaceous rocks lie in a belt up to 80 km. wide between the northern shore of Scoresby Sund and Store Koldewey Island (70°25′–76°20′ N.). The stratigraphy, tectonic structure and history, geography of East Greenland during the Jurassic and Cretaceous periods, lithological features and probable conditions of deposition of the formations are reviewed. Comparisons are made with Jurassic and Cretaceous rocks of West Greenland and Spitsbergen showing important resemblances. Correlation and affinities of the fossil assemblages are discussed in detail. Evidence on the Continental Drift, the East Greenland coast during the Jurassic and Cretaceous periods, the origin of the North Atlantic Ocean, and the date of the beginning of igneous activity is examined. Work still to be done is surveyed. The appendix contains comments on coal discoveries in the area.

50605. DORF, ERLING, 1905– . The earth's changing climates. (Weatherwise, Apr. 1957. v. 10, no. 2, p. 54–59, port., 4 text maps, graph.) 10 refs.

General article on climatic changes and methods of study through use of fossil plants, shell-fish assemblages, climatically-sensitive vertebrates, diagnostic features of rocks, and computations based on heights of continents, relative percentage of land vs. water areas, volumes of warm currents reaching the Arctic, amounts of volcanic ash in the atmosphere. Climatic changes in the Cenozoic are traced: cool period in the Paleocene; warm period in the Eocene in which temperate forests were formed in central Alaska and West-central Greenland, and polar regions were free of icecaps and extensive glaciers; cooling in the Oligocene and Pliocene, leading to the ice ages of the Pleistocene; the present warming trend toward an interglacial age.

in Russian. Summary in English. ***Title tr.:*** Geochemical features of the weathering processes in nepheline-syenites of the Khibiny Tundra.

Outlines chemical weathering processes in the Khibiny alkaline massif. Minerologic, petrographic and geologic features of the massif are reviewed. Tectonic breaks lead to development of linear weathering which differs in steeply and gently sloping zones. Despite similarity of the rocks and their age the weathering takes place differently because of variation in water movement, surface water drainage, and pH solution. The chemical weathering processes are outlined for two zones; the differences lead to differences in association of minerals.

50611. DOUGLAS, R. J. W. Canadian Operation "Mackenzie," 1957. (Polar record, May 1958. v. 9, no. 59, p. 144–46, map.)

Gives summary account of the Geological Survey's helicopter-assisted reconnaissance of the upper Mackenzie River drainage basin, extending from 60° to 64° N., and from the boundary of the Interior Plains with the Precambrian Shield to 126° W. Objectives were: to investigate and correlate the sequence, variations and mode of origin of bedrock formations; to prepare geological maps of the plains at 1 in.: 8 mi., and at 1 in.: 4 mi. on the mountains; assess oil, gas, coal and mineral possibilities; and collect data on superficial and glacial deposits. The 29-man field party, using two Bell 47D1 helicopters and a De Havilland Beaver, mapped the bedrock and glacial deposits in a 100,000 sq. mi. area, described and sampled 225,000 ft. of stratigraphic section and collected fossils.

50612. DOUGLAS, R. J. W. Operation Mackenzie. (Canadian mining journal, Aug. 1958. v. 79, no. 8, p. 64–70, illus., text map, tables.)

Reconnaissance study of 100,000 sq. mi. in southwest Mackenzie-southeast Yukon surveyed in May–Aug. 1957 by a party of 29. Nature of terrain and general geology are described; equipment is noted, including two helicopters and a De Havilland Beaver, a river boat and barge, portable radios, etc. Utilization of the aircraft and operational procedure are explained in some detail, also movement of supplies, establishment of bases, and travel by personnel, etc. Results attained in a four-month period by nine geologists at a cost of $167,500, were much greater than could have been achieved by separate parties, or by conventional reconnaissance methods. Limitations and advantages of the Bell helicopters and the Beaver are given.

50614. DOVERS, ROBERT. My friends, the huskies. New York, Farrar, Straus and Cudahy, 1957. 236 p. illus. maps.

Narrative of this Australian explorer's experience in Adélie Land, attached as observer to the Paul-Émile Victor Expedition during 1952. In charge of the dog team he had opportunity to study the animals, whose rearing and growth, behavior and character as well as struggle for dominance and leadership, he describes with great insight. A chapter (p. 62–82) is largely devoted to emperor penguins, their biology and ecology, development, and adaptation to extreme cold.

Copy seen: DLC.

50615. DOVERS, ROBERT. A surveyor in the Antarctic. (Australian surveyor, Mar. 1957. v. 16, no. 5, p. 272–79, illus., map.)

Describes difficulties in surveying under severe climatic and topographical conditions. Some of the procedures and equipment used on three expeditions are described briefly. The difficulties are not unusual for polar areas; winter surveying was complicated by extra snow cover, but stars available throughout the entire 24 hours facilitated the obtaining of good positions. Heavy clothing on the main part of the body, but light silk gloves or woolen fingerless mittens for the hands is recommended; A method of numbering the exposed plates should be built into the surveying camera.

Copy seen: DLC.

50616. DOWLING, HARRY F., *and others.* Transmission of the common cold to volunteers under controlled conditions, 3; the effect of chilling of the subjects upon susceptibility. (American journal of hygiene, July 1958. v. 68, no. 1, p. 59–65, illus., table.) 21 refs. *Other authors:* G.G. Jackson, I. G. Spiesman, *and* T. Inouye.

Male and female volunteers infected with common cold were chilled at 60° F. and 80% humidity, or at 10° F. and

same humidity, or placed in a surrounding of 80° F. with 30% humidity. No significant differences in incidence of colds were noted between the three groups. No relationship was observed between experimental-cold incidence and the seasons or the differences between outdoor and experimental temperatures.

Contains a description of *Micracanthia ripula* n. sp., a new saldid, from Churchill, collected Aug. 10, 1935, by Dr. W. J. Brown. ***Copy seen:*** DA.

50622. DRALKIN, ALEKSANDR GAVRILOVICH. Dreĭf stantsii "Severnyĭ polius 4" v pripoliusnom raĭone tsentral'nogo poliarnogo basseĭna. (Morskoĭ flot, June 1958. god 18, no. 6, p. 21–22, table, map.) Text in Russian. ***Title tr.:*** Drift of the station "North Pole-4" in polar region of the Central Arctic Basin.

Data on drift of this station in the third and last year of its work, Apr. 1956–Apr. 1957, are given and analyzed by the head of the third team that manned the station. The drift started on Apr. 8, 1954 at 75°48′ N., 178°25′ E.; after two years, on Apr. 18, 1956, the station was at 87°24′ N., 177°49′ W.; on July 5, 1956, it passed the North Pole at 12.7 km. distance (89°53′01″ N.); and it was evacuated on Apr. 20, 1957, at zero meridian (Greenwich) and 85°52′ N. Tabulated monthly data are given on length, mean velocity and direction of actual and net drift, their relation and the mean wind velocity. Factors affecting the drift: distribution of air pressure over the Arctic Basin, cold air currents from Greenland and Canada, ice conditions, and their interrelation are discussed and evaluated. The decisive influence of air pressure and prevailing wind is stressed. Rate of drift from the vicinity of the North Pole toward the Greenland Sea in Oct.–Dec. 1956 was four times slower than that of the first drifting station in 1937 (5 km./day) and

four-and-a-half times slower than that of the ice-breaker *Sedov* in 1939 (5.76 km.).

50624. DREVER, HARALD IRVING, 1912– . Geological results of four expeditions to Ubekendt Ejland, West Greenland. (Arctic, 1958. v. 11, no. 4, sketch maps, illus.) 14 refs.

Outlines petrological discoveries made in 1938, 1939, 1950 and 1957 by British expeditions to this island in the Umanak Fjord region: an abundance of magnesia- and lime-rich intrusions and lavas; a central intrusive complex in the south where acid and basic magmas co-exist; and a suite of dykes, lavas, and pyroclastic rocks on the west coast. Status of research on problems raised by these findings is reported. Discussion is included of author's investigations in 1957 of the olivine-rich rocks in the lower group of lavas and the minor intrusions cutting them. Detailed information on variations in the intrusions and on their relationship with the lavas is presented.

50629. DRIVER, HAROLD EDSOW, 1907– , *and* W. C. MASSEY. Comparative studies of North American Indians. Philadelphia, 1957. 456 p. illus., tables, diagrs. 163 text maps, fold. map. (American Philosophical Society. Transactions, new ser. v. 47, pt. 2.) Approx. 500 refs.

An exhaustive work on means of subsistence, material culture, economics and social organization of North American Indians including the Eskimo-Aleuts, Nadene group (Eyak, Tlingit, Haida and Athapaskan) and the Algonquian language family. The topical data are discussed, mostly in geographical order within the chapters, and summarized on 163 schematic maps (key at end) originally pub. in No. 50630. Arctic material forms a comparatively large part of the study, especially in chapters on hunting, fishing, food preparation, its preservation, storage, and religious rites connected with food providing; means of transportation (snowshoes, dog driving, boats), housing (snow, stone-earth-whalebone and earth-covered houses), clothing, arts and crafts, weapons, trade and barter, inheritance and property rights (hunting grounds), marriage, family and kin groups. Functional, evolutionary and historical theories are reviewed in conclusion. Topical refs. are given at end of each chapter; an extensive bibliography and a subject index are appended. Reviewed (in Russian) by I͡U. Averkieva (Sovetskai͡a ėtnografii͡a, 1958, no. 5, p. 154–61, refs.) who commends the factual data on culture and economy but takes issue with the authors' empiric and nonmaterial approach to problems of social organization in primitive society.

50632. DROGAĬT͡SEV, D. A. Poperechnai͡a sistema koordinat dli͡a Arktiki. (Problemy Severa, 1958, vyp. 1, p. 346–53, illus., tables, map.) 3 refs. Text in Russian. ***Title tr.:*** A lateral coordinate system for the Arctic.

For solution of some meteorological and hydrological problems, it is convenient to regard the trapezoids between coordinates as uniform. In view of the convergence of longitudinal meridians at the North Pole, this method cannot be applied to the high latitudes. By turning the coordinate system 90° around an axis perpendicular to the earth's axis of rotation, the equator becomes a meridian, and the polar regions divided into relatively uniform squares. The coordinates of any given point in the new system may be found by simple trigonometric computations from its geographical coordinates; computed value of latitude, longitude, and difference in azimuth are tabulated in steps of 2.5°.

Outlines the procedure and difficulties encountered in drilling in the river bed beneath 3–5 m. water and 1 m. ice; the 24 prospecting holes bored averaged 5.5 m. in depth. Two drilling machines and a hand-drill were used; the work was done between Feb. 1 and Apr. 15 near Krasnoyarsk. The time required for setting up a drill shed, drilling, and moving the aggregate is reported and graphed. ***Copy seen:*** DLC.

50637. DRUMMOND, JACK CECIL, 1891–1952, *and others.* The examination of some tinned foods of historic interest. Greenford, Eng., 1938. 20 p. illus., diagrs. (Tin Research Institute. Publications, no. 85.) *Other authors:* W. R. Lewis, T. Macara, G. S. Wilson, and H. L. Shipp.

Summarized in *Tidsskrift for hermetikindustri* Oslo, 1939–1940, årg. 25–26, p. 335–37.

The early development of the canning industry is reviewed. As soon as tinned foods were considered dependable, they were used in large quantities by the English Navy; of £5481 worth contracted for in 1818, £1642 worth was assigned to arctic expeditions. Sir John Ross had taken some on his Baffin Bay expedition in 1814, as did Kotsebu in 1815, and Parry in 1819. Some 75,000 lbs. of tinned meats and vegetables were ordered for his 1824 expedition. Some of this, dumped on the ice when the *Fury* was lost in 1825, was found by Ross (in perfect condition) on his 1829–33 expedition and taken back to England. Tins of carrots and roast beef opened recently and chemically and bacteriologically analyzed, are described. On his second arctic voyage Parry also took lemon juice, sliced lemons, cranberries, pickled cabbage and onions, and potatoes. Some of the tinned food carried by Franklin's last (1845) expedition, found later on Beechey Island, was unfit for consumption. Tinned roast beef returned from Sir Edward Belcher's arctic expedition of 1852, and recently opened, is also described. ***Copy seen:*** DLC.

50638. DRUMMOND, R. NORMAN. Iron ore from sub-arctic Quebec-Labrador, Canada. (Polarboken 1957, p. 124–38, illus., map.) 5 refs.

Describes mining activities of the Iron Ore Company of Canada and the community at Knob Lake (54°48′ N. 66°58′ W.), where about 2,000 men are em-

ployed. Physiography, vegetation, climate and exploration of the Quebec-Labrador Peninsula are outlined. Large-scale development of the ore deposits at Knob Lake was decided upon in 1950, a railway was built between the site and Seven Islands on the Gulf of St. Lawrence (completed in 1954) and the ore is shipped out during April to November. An analysis is given of the ore bodies; all lie at the present erosion surface, so open pit mining is used exclusively. Production in 1954 was 1,781,453 tons; in 1956: 12,000,000 tons (60% of the total Canadian output). Other development programs in mineral exploitation are noted. ***Copy seen:*** DLC.

50639. DRUMMOND, R. NORMAN. Research at the McGill Sub-arctic Research Laboratory. (Canadian geographer, 1958. no. 11, p. 45–46.)

Summary paper presented at the 7th annual meeting of the Canadian Association of Geographers at Ottawa, 1957. Describes the establishment during summer 1954 of McGill University's laboratory at Knob Lake, northern Quebec. Studies in glacial geomorphology, climatology, botany, human and economic geography are noted as typical of problems to be solved in subarctic areas. A meteorological observation station is operated for the Dept. of Transport; properties of snow and lake ice are studied; observations of seismic activity are made. An Ionosphere Research Station has been set up by Dartmouth College, and a project for the measurement of backscatter initiated by the Radio Wave Propagation Laboratory of Stanford University. ***Copy seen:*** DGS.

Notes field work of some 30 recent graduates of McGill University, Montreal: locality and problem of study are stated. ***Copy seen:*** DLC.

50655. DUNBAR, MAXWELL JOHN, 1914– . Physical oceanographic results of the *Calanus* expeditions in Ungava Bay, Frobisher Bay, Cumberland Sound, Hudson Strait and northern Hudson Bay, 1949–1955. (Canada. Fisheries Research Board. Journal, 1958. v. 15, no. 2, p. 155–201, illus., tables, maps.) 20 refs. *Calanus* series no. 15.

A summary of the work of these expeditions with bathymetric maps of the Ungava, Frobisher, and northeast Hudson Bay. Temperature, salinity and density profiles are presented; they indicate the presence of Atlantic water below 100 m. in Cumberland Sound, less in Ungava Bay and Hudson Strait. Density inversions, stability conditions, tidal action, vertical water exchange, etc. are also reported. ***Copy seen:*** DLC.

50656. DUNBAR, MOIRA, *and* **K. R. GREENAWAY.** Arctic Canada from the air. Ottawa, Queen's Printer, 1956. 541 p. illus., 50 maps incl. fold. (Canada Defence Research Board.) Approx. 300 refs.

Prepared to aid map reading and for general information of airmen, based on air photographs, the literature and personal observations, and intended to replace No. 35010 which predated the

air photographic program in this area. The Canadian mainland above the treeline, 19 major islands and island groups, the islands waters, and the central Arctic Basin are treated in turn. For each (as relevant), exploration, settlement, topography, drainage, and coastline are described and extensively illustrated. The islands are treated in physiographic sections though simplified, and the coastal configuration emphasized as pertinent for fliers. For the marine areas, submarine topography, surface water and ice conditions are described, the last in some detail with regional accounts of the islands waters. Weather is outlined (p. 450–79) from the airman's viewpoint. Arctic aviation is reviewed from Andrée's attempt in 1897 to about 1955, with special attention to Canadian activities and notable flights, etc., in the North American area. A brief characterization of the Canadian Arctic introduces this basic, though non-technical, study; a chronology of expeditions to the area, glossary, and index are provided, the last including several hundred specific localities treated in text and illus. The photographs, some five hundred in all, though not all in sharp reproduction, are mostly obliques from the tremetrogon series at 20,000 ft. ***Copy seen:*** DLC.

50656A. DUNBAR, MOIRA. Curious open water feature in the ice at the head of Cambridge Fiord. (*In:* International Union of Geodesy and Geophysics. Association of Scientific Hydrology. Report 1957. v. 4, *pub.* 1958, p. 514–519, illus.) Refs.

A circular pool was observed in fast ice in this fiord (72°20′ N., 74°44′ W.) in northeast Baffin Island in 1951. It was 312 ft. diam. within a right-angular indentation of the coast, which on each side was 600 ft. from the pool center. Observed regularly the pool remained in the same location but varied in diam. and disappeared temporarily during Feb.–Mar. 1953. Its origin is discussed: it may derive from a spring below the permafrost. ***Copy seen:*** DGS.

50658. DUNSTAN, D. J. Caudal presentation at birth of a humpback whale, *Megaptera nodosa* (Bonnaterre). (Norsk hvalfangst-tidende, Oct. 1957. årg. 46, nr. 10, p. 553–55, illus.) Text in Norwegian and in English. 4 refs.

A pregnant humpback whale was harpooned off Norfolk Island (29°03′ S. 167°55′ E.) in Aug. 1957. About three feet of the tail of a full-term foetus was projecting from the vulva, the first recorded case of a free-swimming humpback taken in this condition. Tail presentation at birth is thus established to occur, evidence indicates it may be the usual method. ***Copy seen:*** DLC.

50659. DUNWOODY, DERM. Arctic crossroads of the air. (Imperial oil review, Dec. 1957. v. 41, no. 6, p. 19–22, illus.)

Discusses background of the airport at Frobisher, Baffin Island, and its development as an international refueling point on trans-polar routes. Built by the U.S. Air Force during World War II, it was turned over, Sept. 1, 1957, to the Canadian Dept. of Transport, which plans to extend runway from 6,000 to 9,000 ft., and build a passenger lounge, etc. Imperial Oil Co. took over construction of storage tanks and pipe lines, and delivered fuel by tanker during summer 1957. Construction costs (given) are roughly four times

those in southern Canada. The Eskimo workers' modern way of life is noted. Six major airlines expect to be routing planes through Frobisher by late 1958.

Petrographic samples of sub-bituminous coals of Cretaceous age, were collected summer 1956 from Meade River (approx. 71° N. 156° W.), Wainwright (70°39′ N. 160°10′ W.) and Umiat (69°25′ N. 152°20′ W.) Thin-section techniques were used successfully on block and crushed samples. The Meade River coals contain high concentrations of vitrinoid material (all more than 85%) and exceptionally low quantities of fusinoid material (0 to 0.2%). The Wainwright samples have an abundance of exinoids, particularly cutinite. The Umiat samples contain a large amount of highly mineralized attrital coal; the intimate mixture of clay-sized mineral material and organic matter forms a matrix for the attrital coal of these samples. ***Copy seen:*** DGS.

50664. DUTILLY, ARTHÈME ANTOINE, 1896– , *and others*. Contribution à la flore des îles (T.N.O.) et du versant oriental (Qué.) de la Baie James. Washington, D.C., 1958. 199 p. 3 illus., 12 text maps. Duman. ***Title tr.:*** Contribution to the flora of the islands (NWT) and the eastern slope (Que.) of James Bay.

Topographic and ecological conditions are described. The climatic zones (including three coastal belts) are distinguished: Jones (54°34′ N. 79°38′ W.) to Attikuan Point; south to Fort George River; south of this river, including Charlton and Agamaski Islands; the interior region. Typical plants are listed for each zone. Spruce, balsam and birch occupy the islands and coast area (*Picea glauca, P. mariana, Populus balsamifera, Betula papyrifera,* etc.) Seven zonal subdivisions, their habitats, character-

istics, and typical plants are presented: calcareous habitat, dry shores, moist shores, estuaries, coastal marshes, interior swamps, and forest zone. The taxa of the region, comprising 241 genera, 719 species, 255 subspecies and 96 forms, are listed (p. 27–174) with distributional and ecological notes and data on specimens. Information is added on collectors and localities. ***Copy seen:*** DA.

Describes the research program of this Commission set up by the International Geographical Union, and outlines progress to date. The main problems re-

quiring study include the cartographic representation of periglacial phenomena throughout the world, and the dynamic interpretation of general and local periglacial features and their geographic and temporal variations. The specific general problems requiring special attention are structural soils, chemical weathering, slope formation and equiplanation, depression and asymmetric valley formation, rock debris, pingo-like depressions associated with permafrost degradation, frost-action gullies, and periglacial sedimentation. The most important regional problems needing detailed study include: the extent of permafrost, active-layer thickness, the relation between various glacial and periglacial periods, climatic and morphogenetic types of periglacial phases, differentiation of periglacial phenomena in the general relief, the characterization of present periglacial zones, practical applications of periglacial research, and terminology. The organization of studies and dissemination of information are also considered. The program is to be presented to the International Geophysical Congress in Stockholm in 1960.—From SIPRE.

50672. EADE, KENNETH EDGAR. Geological reconnaissance by helicopter in New Quebec. (Canadian mining journal, Apr. 1958. v. 79, no. 4, p. 118–21, illus.) 7 refs. Paper to 26th annual Convention of the (Canadian) Prospectors and Developers Association, 1958.

Presents historical background, organization of survey party, operational procedure, and appraisal of this method of geological reconnaissance. Operation Fort George (53°50′ N. 79°01′ W.) was carried out by the Geological Survey of Canada, beginning before break-up in 1957; approx. 35,000 sq. mi. east of James Bay was mapped on a scale of 1 in.-8 mi. with a Bell 47G and a De Havilland Beaver helicopter. Of the total area, about 750 sq. mi. is underlain by Archean volcanic rocks with associated minor amounts of meta-sedimentary rocks. The variation in forest cover from barren ground to heavy coniferous forest required a change in mapping technique. On the Hudson Bay coast and the adjacent islands are Proterozoic rocks. Major folding is recognized in granite and granite gneiss in the central part of the area. Presence of copper and iron deposits may be of interest to prospectors.

Describes efforts since 1950 of a state-owned forest district in lower Norrbotten to get and retain workers. The district, which includes a desolate area between the Pite and Lule Rivers, has sparse population and a low standard of living. Lumbering used to be seasonal winter work, and in the 1940's many local workers moved to the cities. Since 1950, the necessity for stream-lining forest work, and providing permanent employment, good wages, housing, etc. is recognized. A community housing program has been started, with schools, health and social facilities; also building loans and vocational courses for forestry employees. ***Copy seen:*** DA.

50678. EBELING, FREDRIK HARALD, 1909– . Lövskogen och återväxtproblemen i det norrländska skogsbruket. (Sveriges natur. Årsbok, 1957. årg. 48, nr. 4A, p. 40–53, illus.) Text in Swedish. ***Title tr.:*** The deciduous forest and the regrowth problem in Norrland's forestry.

Forestry in this northern province of Sweden is now midway from the old regime of exploitation to production of recent growth. The cubic mass is about equal to that of 1926 but large mature trees are mostly replaced by secondary shoots, and the struggle against unwanted deciduous vegetation (birth, willow, alder, and others) is intensive and costly. Seeds of deciduous trees mature in one year, pine requires three consecutive good seasons for budding, blooming, and seed production of a good harvest. Spruce requires two years. Conifers do not grow from roots or stumpage. Clearing and burning are necessary to provide soil nutrients and sunlight which decrease with latitude and altitude. Species must be evaluated for future uses and growth requirements and consideration given to the scenic, faunal, and floral assets of mixed forests. ***Copy seen:*** DLC.

50679. EBELING, FREDRIK HARALD, 1909– . De nuvarande Norrlandslinjen inom svenskt skogsbruk - tillfällig mo-

deriktning eller välgrundad nydaning? (Skogs- och lantbruks-akademien. Tidskrift, 1957. årg. 96, nr. 4, p. 264–88, illus., maps.) Approx. 150 refs. Text in Swedish. Summary in English. ***Title tr.:*** The present policy in Norrland forestry; a passing fashion or well-founded planning?

The new forestry methods have evolved as a result of experiments in the period of transition from former exploitation to production for the future. Biological factors are taken into account in areas where nutritive resources of the soil are scarce and competition is keen among trees, and between trees and other vegetation. Future profits are a factor in planning for larger and uniform wood lots suited to modern techniques, and in study of potential uses of timber in years to come. ***Copy seen:*** DA.

50680. ECKARDT, THEO. Bericht über den gegenwärtigen Stand der "Flora der UdSSR." (Botanische Jahrbücher für Systematik, Pflanzengeschichte und Pflanzengeographie, May 1957. Bd. 77, Heft 2–3, p. 218–25.) 2 refs. Text in German. ***Title tr.:*** A report on the present status of *Flora SSSR*.

The history of this important flora (No. 9058, 30132 and 35655 of *Arctic Bibliography*) is outlined and comparison made with the first complete Russian flora of K. F. Ledebour (No. 9808). Some aspects of the work as a whole are critically considered, and each volume in turn is briefly reviewed. In all they cover an estimated 17,000 species (in 160 families), as compared with 6668 species, 1139 genera and 146 families in Ledebour's work. The largest family is Cyperaceae with 533 species, followed by Ranunculaceae (513 species); the largest genus is *Astragalus* with 849 species (compared with 168 species recorded by Ledebour). A tendency to split the genera and the strong influence of the taxonomic concepts of the first editor V. L. Komarov (who died in 1945) are noted, as well as some useful innovations such as giving the species' total distribution, its economic importance, occurrences of fossil representatives, etc. The flora is considered as an important contribution to botanical science.

Salmon are found in rivers throughout Norway but the annual harvest is small. The life cycle is described: increased catch depends on conditions in streams where salmon are hatched, on their return from the sea to spawn, and on regulation of both coastal and inland catch from May to late summer. Adequate fish ladders, and protective measures are required, the latter especially where industrial construction affects fish traffic in rivers. ***Copy seen:*** DGS.

In an environment of 3–8° C., metabolic rate in dogs less than six days old, almost doubled from thermoneutrality (ca. 30° C.), yet rectal temperature dropped several degrees. In older animals, especially those more than three weeks old, metabolic rate also doubled but core temperature remained fairly constant, suggesting that inability to regulate temperature in the newborn is not due to low heat production but rather to high heat loss.

50717. EIDHEIM, HARALD. Erverv og kulturkontakt i Polmak. Oslo, Norsk Folkemuseum, 1958. 68 p. maps, tables, diagrs. (Samiske samlinger. bd. 4, pt. 1.) About 30 refs. Text in Norwegian. Summary in English. ***Title tr.:*** Economic life and cultural contacts in Polmak.

Polmak (70°03′ N., 28° E.) in North Norway had, at the 1950 census, 970 inhabitants, 90% Lapp, 10% Norwegian and mixed. The author worked there as a school teacher in 1947 and 1948 and visited the area in 1952 and 1953. The climate (average yearly temperature −0.6° C., average precipitation 350 mm.) and natural resources are outlined. Income per capita is very small and state subsidies large. The population has increased by 90% since 1920 due to a remarkably high nativity rate and decrease in infant mortality. In the same period, emigration and immigration have been in balance. That few people leave the region is attributed to social conflict between Lapps and Norwegians creating a barrier around areas with a predominantly Lapp population.

50718. ÉÏGENSON, M. S. O vozmozhnoï prirode paleoklimaticheskikh kolebaniï v techenie chetvertichnogo perioda. (Akademiâ nauk SSSR. Komissiâ po izucheniîû chetvertichnogo perioda. Trudy, 1957. t. 13, p. 427–33.) Text in Russian. ***Title tr.:*** On the possible nature of paleoclimatic fluctuations during the Quaternary period.

Presents information on solar activity and its cyclic changes. The various cycles of solar activity have time intervals of 5.5 to 11, 24, 44, 80–90, 600 and 1,500–2,000 years. These intervals are evaluated and comparison with the periods of Quaternary history is discussed. Some coincidence is recognized. Changes of solar activity are considered a cause of earth glaciation, particularly of Quaternary glaciation. The climate of the present period has in general a compensating character, the polar and subpolar zones warming up and a slight cooling in tropical and subtropical zones.

50720. EINARSEN, JOHAN, 1903– . Fiskeripolitikk; forelesninger holdt over norsk fiskeripolitikk ved Universitetet i Oslo. Oslo, Nov. 1954. 113 p. tables. Refs. in Text. Text in Norwegian. ***Title tr.:*** Fishing policy; lectures on Norway's fishing policy given at the University of Oslo.

Combined geographic, hydrologic and marine biological factors make the western and northern shores of Norway an unusual fishing ground. Herring in the west and cod in the north are most important. Fisheries are a major part of the national economy, hence the development and regulation of fishing policy is in the national as well as the fishermen's interest. Local labor, financial, and technical changes, and international interests are explained. The rise of seining and trawling in Lofoten since 1942 is dealt with (p. 93–109). The controversy with England over territorial limits is discussed (p. 109–113). The Norwegian law of 1935 concerning a four-mile limit north of 66°28.8′ N. was found in accordance with international law by the Hague ruling of 1951, a decision of importance also to Iceland, where limits were drawn accordingly for the entire coast in 1952.

50723. ÉĬNOR, OL'GERT LEONARDOVICH. Korrelя̂tsiя̂ i vozrast osnovnykh razrezov verkhnego paleozoя̂ Pechorsko-Kuznet͡skoĭ uglenosnoĭ oblasti. (Sovetskaя̂ geologiя̂, Jan. 1958. god 1, no. 1, p. 25–39, table.) 60 refs. Text in Russian. Summary in English. ***Title tr.:*** Correlation and age of main cross-sections of the Upper Paleozoic in the Pechora-Kuznetsk coal-bearing province.

Tectonic movements and paleogeography were similar in the Pechora coal basin and the great West Siberian depressions during the Carboniferous and Permian periods. Comparison is made of the character of the geological sections, their fauna and flora and geological history of the Pechora coal basin, the Pay-Khoy Mountain range, the Taymyr, the Tunguska depression of the Precambrian Siberian platform and of the Kuznetsk and some smaller, adjacent depressions. "The replacement of marine formations by coal-bearing lagoon and later on by purely coal-bearing continental formations is typical of all those regions." The results of synchronization of standard sections in the Pechora, West Taymyr, Tunguska, Kuznetsk, and Minusinsk basins are shown (p. 27). The coal-bearing deposits of all these basins belong to the Lower and Upper Permian. The age of the continental-marine Ostrog

series in the Kuznetsk basin is still controversial. ***Copy seen:*** DLC.

50730. EKLUND, BO. Årsringsbreddens klimatiskt betingade variation hos tall och gran inom norra Sverige åren 1900–1944. Stockholm, 1955. 150 p. tables, graphs. (Stockholm. Statens skogsforskningsinstitut. Meddelanden, bd. 44, nr. 8.) 42 refs. Text in Swedish. Summary in English, p. 140–50. ***Title tr.:*** Variation in the widths of the annual rings in pine and spruce due to climatic conditions in northern Sweden during the years 1900–1944.

From core samples from undisturbed stands of pine and spruce in northern Sweden, annual ring index series were derived which permit evaluation of climatic conditions as expressed by ring widths for individual years. The two trees record the influence of climate in a markedly different manner. But when allowance is made for the difference, the two adjusted index series are in striking agreement. Secondary climatic factors, blooming and cone production, geographic location, site, altitude, latitude, and ground moisture conditions can also be represented by annual ring index series. Comparative studies of extreme good and bad years and meteorological records might enable derivation of climate functions. Methods of deriving the indices

and their use for forest thinning and volume calculations are discussed.

Greenland's geology is outlined with emphasis on the mineralogical development. Pertinent areas are described and illustrated by profiles. Chemical and mineralogical data on assays examined 1933–34 are tabulated, and a geological and technical account is given of discoveries in northeast Greenland, based on the author's field work 1933–34 in the Scoresby Sund area, northern part of Jameson Land, and the area between 73°20′ N. and 76° N.; also on mineralogical observations made by various geologists before 1934. ***Copy seen:*** DLC.

50732. *ELECTRONICS.* Antenna alarm anticipates ice on DEW Line. (Electronics, Oct. 1, 1957. v. 30, no. 10, p. 216, illus., diagr.)

The unit, consisting of a detector mounted on the antenna and an indoor control box, gives warning of conditions (temperature/precipitation) favorable for ice formation. Precipitation on the heated detector coil causes a short circuit which increases the grid voltage of a cathode-follower amplifier, coupled through a transformer to the alarm system. A thermostat is connected in series with the detector coil, and the alarm remains inoperative unless both conditions for ice-formation exist concurrently. The antenna heater can be controlled automatically by the alarm.

Copy seen: DLC.

50733. *ELECTRONICS.* Military research pays off. (Electronics, June 1, 1957. v. 30, no. 6, p. 16, 20, graph.)

Contains brief account of some of the developments in the field of electronics which will make polar flight safer and more useful. Navigational radar devices enable a plane's crew to determine the nature of the surrounding terrain, detect bad weather, and locate nearby planes. Planes equipped with radar profile recorders are currently mapping some 40,000 sq. mi. of Baffin Island.

50746. ELVEY, CHRISTIAN THOMAS, 1899– , *and* **A. BELON.** Description of the all-sky camera, its method of operation; an instrument (Ascagraph) for measuring the film. College, Alaska, 1957? 43 p. illus., diagrs., maps. (Alaska. University. Geophysical Institute. Scientific report no. 1, IGY Project no. 1.1, NSF grant no. Y/1.1/44.)

Contains a comprehensive description of this camera which has been employed on a routine basis for auroral observations. Two camera models, one a synchronous model with an electric 24-numeral clock, the other with a mechanical clock, are planned to operate automatically. The camera will be used to obtain auroral photographs at stations throughout Alaska, the United States generally, and in the Antarctic as part of the IGY program. Instructions for installation and operation of the equipment are given. Observations will be reduced to prepare synoptic maps at 15 min. intervals during the IGY Regular World Days and the Special World Intervals. Two methods used in preparing synoptic maps for observations with cameras located at College and Point Barrow are given. A simple recording device known as an ascagraph is described for transferring, semi-automatically, the data from the camera film to the synoptic map.

Reviews voyage of the *Nautilus,* July–Aug. 1958. Layout of the submarine's interior is illustrated, its main specifications are given. ***Copy seen:*** DGS.

50753. *ENGINEERING.* Navigating across the Pole; problems in guiding submarines. (Engineering, Aug. 22, 1958. v. 186, no. 4824, p. 238, illus.)

Discusses systems applicable to submarine navigation: astro-navigation, echo-sounder, dead-reckoning, and inertial guidance; only the latter two effective in the vicinity of the Pole. Navigational equipment of the *Nautilus* is reviewed; position determined by "solar fix" after 1,830 mi. submerged was within ten mi. of that established by its dead-reckoning, estimated, and SINS systems.

Copy seen: DGS.

50754. *ENGINEERING AND CONTRACT RECORD.* Soils problems differ on northern roads. (Engineering and contract record, Sept. 1958. v. 71, no. 9, p. 112–13+, illus.)

Main problems are excavation of moss and frozen material, long hauls, and need of special light equipment. One part (by Mannix Co., Ltd.) of a $250 million road (1200 mi.) and bridge-building program in the Yukon and Northwest Territories is described: the Dawson-Aklavik road with subsidiaries to Flat Creek, Eagle Plain Oil Reservation, and Clinton Creek; a 550-mile link between Great Bear and Great Slave Lakes (underway); and the Port Radium-Coppermine road (pro-

jected). Grading of the Fort Rae-Yellowknife road calls for 26-ft. subgrade, with a sand coat and quarry-crushed rock top. Drainage ditches are completed before the scrapers build the fill; fill is placed over moss and brush buried along the centerline to act as insulation for permafrost base. Scrapers remove 12 in. of material at three-four day intervals, allowed for thawing. Transportation of personnel and equipment is briefly dealt with. ***Copy seen:*** DLC.

50755. ***ENGINEERING AND MINING JOURNAL.*** Tractor-ripper slices frozen ground. (Engineering and mining journal, Oct. 1958. v. 159, no. 10, p. 93–94, illus., tables, diagrs.)

A new technique for excavating frozen ground, using a ripper mounted on a Caterpillar D9 tractor, is described. Performance and cost data from a mining company are tabulated and compared with the blasting method. The excavation procedure consists essentially of ripping in an established pattern of furrows 6 in. deep to provide additional traction for further passes, and cross-ripping at right angles to the initial furrows. The ripping patterns and procedures are varied to meet material size, handling, and transportation requirements. A straight shank can successfully be used for a variety of materials and penetration depths due to its ability to stay down in blocky and slabby materials, while curved shanks are best used in non-slaty materials.—From SIPRE. ***Copy seen:*** DLC.

50756. ***ENGINEERING NEWS-RECORD.*** Fast-acting ice remover effective at 30 below zero. (Engineering news-record, Feb. 21, 1957. v. 158, no. 8, p. 222.)

Reports development of a chemical exothermic ice remover in pellet form, known as the Tropical Ice Remover; it may be applied safely to good concrete, and will not damage asphalt surfaces.

Copy seen: DLC.

50757. ***ENGINEERING NEWS-RECORD.*** Going up: new line to aid DEW Line. (Engineering news-record, July 17, 1958. v. 161, no. 3, p. 23–24, illus.)

Construction is underway on two Ballistic Missile Early Warning System (BMEWS) stations, one in Alaska and one in Greenland. Scheduled for completion in 1960, the two installations are to cost $800 million. Technical facilities consist of four firing detection or surveillance radars with 400 x 165 ft. reflectors, and three tracking radars for tracing the trajectory; the latter are to be mounted atop the 30 ft. high roof of a 150 x 370 ft. transmitter building, and will have radomes 168 ft. in diameter. Power for the Greenland station will be supplied by three 11,500-kw. steam turbine generators aboard a vessel to be permanently moored near the base and completely enclosed by a wall. Contractors are listed. ***Copy seen:*** DLC.

50758. ***ENGINEERING NEWS-RECORD.*** Insulated forms protect winter pour. (Engineering news-record, July 3, 1958. v. 161, no. 1, p. 56, illus.)

Describes winter concrete protection device used during road construction near Buffalo, N.Y. A blanket of balsam-wool was placed between forms, and wales aggregates were preheated to 50°–60° F.; thermometers inserted into recesses in the concrete to check the heat of hydration. Thermal conductivity of the blanket (two in. thick for pours less than 24 in. thick, one in. for greater pours) was kept under 0.27 BTU/sq. ft./hr./° F. temperature difference between the two surfaces.

Copy seen: DLC.

50759. ***ENGINEERING NEWS-RECORD.*** One way to beat the cold. (Engineering news-record, Feb. 14, 1957. v. 158, no. 7, p. 55, illus.)

Describes an insulated cover system, consisting of steel joists, metal encased fibrous glass insulating panels and tarpaulin sides, permitting production of post-tensioned concrete beams at subfreezing temperatures. Heated concrete is placed in metal forms, the trusses with the insulated covers are pushed forward and the protecting exterior tarpaulins dropped down. Steam is then injected underneath the cover to assure a minimum temperature of 70°–80° F. After five days, the pre-stressing cables are placed in the girder, the beams remaining under the cover another two days. Economical production is claimed due to saving in steam and ease in handling of the insulated covers.

A study of the respiratory gaseous exchange of ten Alaskan male Eskimos and ten whites, during rest and during and after a standard work performance on a bicycle ergometer. The Eskimos showed a higher resting metabolism but their work efficiency was almost the same as of the white. The Eskimos had a shorter recovery time. ***Copy seen:*** DNLM.

50776. ERIKSSON, BACKA E. Glaciological studies on the Mika Glacier in Sarek, 1956–57. (Geografiska annaler, 1958. v. 40, no. 1, p. 67–80, 4 diagrs., graphs, 7 tables.) 13 refs. Sarekstudier 4.

Results of accumulation, density, and ablation measurements made during the spring and summer 1957, on Mikkaglaciär (67°25′ N. 17°42′ E.) of the Sarek Mts. in northwest Sweden. Depth of snow cover in cm., density in gm./m.^{3}, standard deviations of measurements of thickness and accumulation in gm./m.^{2}, winter 1956–57, were measured at 49 places on four levels of the glacier. Comparisons were made with previous observations; mean density was in agreement with measurements on other European glaciers. Ablation measurements were made daily June 16–July 29, 1957, at eight places. Density of snow and firn at the surface, rate of ablation, and total ablation are summarized. Comparison of mean accumulation (95 gm./cm.^{2}) with mean ablation (170 gm./cm.^{2}) at the meteorological station (1,200 m.) resulted in net ablation of 75 gm./cm.^{2}. Ablation for the lower parts of the glacier was probably greater. ***Copy seen:*** DGS.

50777. ERIKSSON, FOLKE. Vintermerkostnader i Norrland. (Byggnadsindustrin, 1957. årg. 27, nr. 17, p. 533–36, diagrs., tables.) Text in Swedish.

Title tr.: Additional winter costs in Norrland.

Contains tabulated and graphed data on the extra, winter-construction costs of three-family dwellings at Umeå and Luleå in 1954–55 and 1955–56. These costs fall into nine groups: concrete work, site-clearing (ice, snow), inside plastering, heating of sheds, ground work, interruptions and reduced working pace, drying, brickwork, and temporary illumination.

Reprinted from Norrlands skogsvårdsförbund. Tidskrift, 1949, häfte 2–3. ***Title tr.:*** Friction of sled runners on snow and ice: 1, general remarks and starting friction; 2, friction and movement, sliding friction.

English translation by W. Nupen pub. by U.S. Army, Corps of Engineers. Snow, Ice & Permafrost Research Laboratory, Wilmette, Ill., (23 p.) Copy at CaMAI.

"Laboratory and field measurements of friction with metal and wooden runners on snow and ice are discussed. Sliding friction was determined by measuring the retardation of freely moving sleds, and initial friction with a dynamometer. Coefficients of sliding friction varied from 0.006 to 0.3, and initial friction from nearly 0 to over 1. The coefficient of friction depends on the finish and dimension of the runner, air temperature, snow-particle size, water content of the snow, sliding speed and stress. Friction usually increases with falling temperatures: for steel runners, it doubled in the temperature range 0° to −30° C. and increased for wooden runners up to 40%. Sliding depends largely on the lubrication effect of the water layer between the snow or ice surface and the runner."—SIPRE.

50788. ESCHSCHOLTZ, JOHANN FRIEDRICH, 1793–1831. Zoologischer Atlas enthaltend Abbildungen und Beschreibungen neuer Thierarten, während des Flottcapitains v. Kotzebue zweiter Reise um die Welt, auf der Russisch-Kaiserlichen Kriegsschlupp Predpriactië in den Jahren 1823–1826 beobachtet. Berlin, G. Reimer, 1829–33. 5 pt. in 1 v. 25 col. plates. Text in German. ***Title tr.:*** Zoological atlas, containing illustrations

and descriptions of new animal species, observed during the second round-the-world voyage of Captain Kotsebu on the Russian royal sloop of war *Predpriiatie* in the years 1823–1826.

Includes descriptions and colored engravings of two land mammals, one from Kamchatka, one from Alaska; two species of birds from Kamchatka; one fish and one echinoid (Alaska) and 18 species of molluscs, including a new genus, all from Alaska. The color of the plates is excellently preserved. ***Copy seen:*** DLC.

50789. ESKERÖD, ALBERT JEAN, 1904– . Early nordic-arctic boats. (Studia ethnographica upsaliensia, 1956. v. 11, Arctica, p. 57–87, illus., diagrs.) 36 refs.

Discusses the construction, evolution and use of primitive watercraft: rafts, dugouts, bark-, skin- and plankboats. Brøgger's theory of a skin-boat origin of the Nordic clinkerbuilt (of overlapping boards) plankboat is challenged, and the latter's derivation from the dugout suggested. ***Copy seen:*** DSI.

50790. ÉSKIN, I. A., *and* N. V. MIKHAĬLOVA. Fotoperiodichnost' i funktsiia gipofiza i kory nadpochechnikov. (Biulleten' éksperimental'noĭ biologii i meditsiny, Aug. 1958. t. 46, no. 8, p. 100–104, illus. tables.) 10 refs. Text in Russian. Summary in English. ***Title tr.:*** Photoperiodicity and function of the hypophysis and of the adrenal cortex.

Data presented by authors indicate the existence of a 24-hr. rhythm in adrenocorticotropic function of the hypophysis and adrenal cortex, depending on light and its duration. This rhythm is manifest in the 24-hr. changes of ACTH in the hypophysis and of ascorbic acid in the adrenal. Disturbance in the normal day-night alternation abolishes these 24-hr. variations. ***Copy seen:*** DNLM.

50791. ESKIN, SAMUEL GEORGE, *and others.* Strength characteristics of ice in contact with various kinds of surfaces. (Refrigerating engineering, Dec. 1957. v. 65, no. 12, p. 33–38, 52, diagrs., tables.) 8 refs. *Other authors:* W. E. Fontaine *and* O. W. Witzell.

Laboratory investigations were made to determine the strength of ice and the forces of adhesion between ice and brass, Teflon (black and white), stainless steel, variously treated aluminum, de-icing lacquer-coated brass, polyethylene, and hardened steel surfaces. White Teflon and polyethylene had the best ice-releasing properties. Data are tabulated on ice strength, adhesion strength, a breaking strength which is a result of a combination of ice and surface structure, and tension and shear strengths of adhesion. ***Copy seen:*** DLC.

50792. ES'KOVA, E. M. Gentgel'vin iz shchelochnykh pegmatitov. (Akademiia nauk SSSR. Doklady, Sept. 21, 1957. v. 116, no. 3, p. 481–83, diagr., table.) 3 refs. Text in Russian. ***Title tr.:*** Genthelvite from alkaline pegmatites.

This mineral first discovered and described from Colorado was found in 1948 in pegmatite veins in Lovozero region of Kola Peninsula. It forms inclusions of irregular shape of colorless or yellow-green grains; specific gravity is 3.55. Chemical analyses of Colorado and Lovozero specimens are presented. The latter has more magnesium oxide (10.21%) and less silicon oxide and beryllium oxide than the Colorado specimen. Spectral analysis shows that genthelvite includes also magnesium, aluminum, calcium, cobalt, tin and titanium. ***Copy seen:*** DLC.

50793. ESKRIDGE, PAUL S. Role played by dietary fat in *Peromyscus* exposed to low temperatures. (Ecology, July 1958. v. 39, no. 3, p. 554–56, table.) 6 refs.

These mice when exposed to cold on diet containing 10% fat began to die within a few hours, but maintained life when the diet contained 35% of the calories as fat. Of two similar groups one kept indoors and the other outdoors (temperature range −21.8° to 66° F.), the latter chose a diet high in fat.

50795. ESPENSHADE, EDWARD B., Jr., *and* **S. V. SCHYTT.** Problems in mapping snow cover. Wilmette, Ill., Dec. 1956. 92 p. tables, maps, graphs, diagrs. 37 refs. (U.S. Army. Corps of Engineers. Snow, Ice and Permafrost Research Establishment. Research report 27).

"The results of a study on the feasibility of mapping selected snow-cover characteristics for military purposes, taking into account both current synoptic and average conditions, are reported in detail, and suggestions for improvement in presentation and accuracy are made. Problems associated with the construction of isolines for depicting individual or combinations of snow-cover conditions are discussed; the need for other statistical parameters in addition to the means is stressed; and the adaptation of frequency and variability indices is suggested. The use of a regional technique, which identifies areas somewhat homogeneous or substantially different from adjacent areas, is investigated; six of the nine major snow regions are in northern Canada. Problems in mapping snow density are also considered as well as the possibility of estimating snow density from meteorological data. Three sets of codes for the systematic recording and transmission of data are proposed, including a code for ground observers, a simplified code for use where no instruments or trained personnel are available, and a code for aerial observations."—SIPRE. ***Copy seen:*** CaMAI.

50797. ESSENE, FRANK J., 1908– . A comparative study of Eskimo mythology. (Kroeber Anthropological Society. Papers, Spring 1956. no. 14, p. 96–97.) Abstract of Ph. D. dissertation, University of California.

Compares Eskimo mythology with that of the Indians in central Canada and the Northwest Coast and Northeast Asiatic tribes. The similarity of mythological elements points to an originally close contact between Eskimos and aborigines of the Pacific Northwest and Asiatic northeast, justifying the assumption of a northeast Asiatic homeland. Though all Eskimo mythology shows primary affinities with that of the Old World, Western Eskimos were influenced later by Northwest Indian lore. Central and Eastern Eskimos developed old motifs into a new and distinctive mythology.

50798. ESSOGLOU, MILON E. Piling operations in Alaska. (Military engineer, July–Aug. 1957. v. 49. no. 330, p. 282–87, illus.)

Describes construction of a reinforced concrete and wood frame composite building by U.S. Corps of Engineers, near Bethel, on the Kuskokwim delta. It is a tundra area of marginal and sporadic permafrost, with average annual temperature 29.6° F. and rainfall 19.07 in. Construction involved artificial freezing of a wooden pile foundation and provision for subsequent refrigeration to keep the ground frozen. Creosoted wood piles, around which were strapped refrigeration coils made of 1-in.-diameter steel pipe, were placed in 18-in. holes of 30 ft. depth, annular space was backfilled

with silty sand of 35% water content, and the piles were frozen back in groups from 4–48 piles. The buildings are raised a minimum of 34 in. above grade; precautions were taken to preserve the tundra intact for 100 ft. from the edge of all roads and buildings.

Expedition in the Arctic Ocean on the vessels *Taĭmyr* and *Vaĭgach* in 1910–1915.

Brief account, by its aerologist, of the expedition headed by Vil'kit͡skiĭ: its preparation, including construction of special ships; its scope and purpose, the four annual trips of 1910–1913; the voyage from Vladivostok to Arkhangel'sk in 1914–15. The main achievements were the discovery of Severnaya Zemlya, a hydrographic survey of its coasts and that of the Taymyr Peninsula, and the first east-west passage of the Northern Sea Route. Map shows routes of both vessels in 1914–1915. ***Copy seen:*** DLC.

50812. EVGENOV, NIKOLAĬ IVANOVICH, 1888– . O raspredelenii poverkhnostnykh solenosteĭ v zapadnoĭ chasti Karskogo moria v 1927 g. i rol' l'dov pri ėtom. (Leningrad. Gosudarstvennyĭ gidrologicheskiĭ institut. Issledovaniia moreĭ SSSR, 1935. vyp. 21, p. 57–64, maps.) 7 refs. Text in Russian. Summary in German. ***Title tr.:*** Distribution of surface salinity in the western Kara Sea and the role of ice in it.

Surface salinity was found (Aug.–Sept.) to vary considerably from year to year, influenced by the fresh water coming down the Ob valley and flowing in a westerly direction towards Novaya Zemlya with a countercurrent of salty water apparently of Atlantic origin. Ice acting as a barrier often blocks the stream of freshwater running west, thus exerting its own influence over great areas.

Lappish culture and occupations are endangered by technological and economic change. Ethnographic studies, such as those under supervision of the Tromsø Museum, are important before the cultural transition to another way of life.

Copy seen: DGS.

50830. FAEGRI, KNUT, 1909– . Omkring grønlandsbygdenes undergang. (Naturen, 1957. årg. 81, nr. 7, p. 432–36) Text in Norwegian. ***Title tr.:*** On the Greenland communities' destruction.

The downfall of the early Norse communities as presented by Gini, q.v., is discussed. Climatic and economic deterioration at Vestribygd is believed to have caused the colonists to adopt a mobile hunters' life such as the Eskimos lived. Insect infestation of the pastures in 1341 probably entailed reduction of the cattle, the basis of permanent settlement. Religious and social degeneration and trouble with Eskimos, discussed by Gini, are not regarded as contributory factors. ***Copy seen:*** DGS.

50831. FAEGRI, KNUT, 1909– . Professor Hulténs nye inndeling av *Cerastium alpinum*-gruppen. (Blyttia, 1957. bd. 15, no. 2, p. 69–71). Text in Norwegian. ***Title tr.:*** New classification of the *Cerastium alpinum* group by Professor Hultén.

Contains a republication of a key to northern species of this group and distributional data, based partly on Hultén's Cerastium glabratum *Hartm., species restituenda* (No. 45644), and some other of his works. The area occupied by this group includes northern regions of Europe, Asia, North America and arctic islands.

"Features of the modification of air masses and daily variations in air temperatures and other meteorological elements over snow-covered areas are ex-

amined on the basis of observations on the Russian plain in 1937–1941. The albedo of fresh, uncompacted snow cover averaging about 80–90% and the low thermal conductivity of snow are the main factors determining differences in meteorological conditions between snow-covered and snow-free areas. The low dust content of the air over snow and the roughness of the snow surface increase the intensity of outgoing radiation, effect intense cooling of the air near the ground, and raise the rate of daily temperature variations."—SIPRE.

Text in Russian. English translation by E. R. Hope, *issued as* Canada. Defence Research Board. Directorate of Scientific Information Service. Translations, July 1959, T329R. 5 p. Copy at CaMAI. ***Title tr.:*** Geographical distribution of auroras in the western part of the Soviet Arctic.

Daily and hourly variations in auroral activity as a function of latitude are discussed for days of low magnetic activity and during magnetic storms, based on hourly observations at 50 stations in the area 67°.3–87°.5 N. 50°–110° E. The analysis indicates a second zone of increased auroral activity at approx. 78° N. in addition to that at 65° N.; its intensity is lower than that at the lower latitude.

50869. FEL'DSHTEĬN, ÎA. I., *and* E. I. KURDINA. Magnitnye variatsii v raĭone zony polîarnykh siîanieĭ. (Problemy Arktiki, sbornik stateĭ, 1958. vyp. 3, p. 53–59, diagrs., tables) 2 refs. Text in Russian. ***Title tr.:*** Magnetic variations in the auroral zone.

Simultaneous recordings of magnetic activity made in 1956 at Dikson Island, Ust'-Tareya, Sopochnaya Karga, and Cape Chelyuskin, also at short (10 km.) distances from the Dikson Observatory, are compared and analyzed with respect to variation in intensity pattern with distance. Greatest difference in form and phase displacement with distance was observed in the vertical intensity; at 800 km. a 180° displacement was not uncommon. Absolute values of horizontal and vertical intensity showed little change at 180 km. south of Dikson, while the change in declination was more pronounced. At limited (10 km.) distances, no change in the fluctuation pattern was observed. ***Copy seen:*** DLC.

Translations, T271R, Jan. 1958. 5 p. copy at DGS. ***Title tr.:*** Compression and rarefaction of ice in the Arctic Basin.

Presents new formulas for calculating changes in ice distribution density under steady and non-stable drift conditions. An index of atmospheric circulation, defined as a quantity proportional to the divergence of the vector-gradient of atmospheric pressure, is introduced, also integral-indices of the atmospheric circulation with respect to area and time, for use in short- and long-range forecasting of local ice conditions. ***Copy seen:*** DLC.

50871. FEL'ZENBAUM, A. I. Teoreticheskie osnovy rascheta dreĭfa l'dov v tsentral'nom Arkticheskom basseĭne. (Akademiîa nauk SSSR. Doklady, Mar. 11, 1957. t. 113, no. 2, p. 307–310.) 7 refs. Text in Russian. ***Title tr.:*** A theoretical basis for calculating ice drift in the central Arctic Basin.

Average (monthly or seasonal) drift is mathematical analyzed. Actual drift, which depends on intermittent factors varying rapidly with time and space, is not considered. The average drift, depending largely on geostrophic (lower tropospheric) wind, can be calculated by integration of Laplace's equation with limits determined from the formulas given. Average drifts of the *Fram* and *Sedov* and the drift stations North Pole 1–4 confirm the conclusions, since they can be resolved into 2/3 gradient (geostrophic) drift and 1/3 wind drift.—From SIPRE. ***Copy seen:*** DLC.

Russian. ***Title tr.:*** A theory of steady ice drift and calculation of the average drift over several years in the central part of the Arctic Basin.

Analyzes factors influencing the drift and presents formulae for computing long-range averages of its speed and direction in general, and at any given location in the Arctic Basin. Mean values of speed and direction of the wind, gradient, complementary gradient, and total drift at junction points are computed, tabulated, and charted. The gradient drift accounts for ⅔ and pure wind drift for ⅓ of the total speed; the gradient drift depends entirely on the water exchange between the Arctic Basin and adjacent seas and oceans (Atlantic, Pacific). Drift over shorter periods (monthly, seasonal), may show great deviation from the several years' averages. ***Copy seen:*** DLC.

Account of investigations of the heart, lungs, adrenals, kidneys and pancreas of dogs made hypothermic for 2–24 hrs. A slightly increased deposition of lipids and depletion of glycogen were found in most of the organs. Only the kidney showed lack of alterations in the substances studied. ***Copy seen:*** DNLM.

50903. FISHER, EDWIN RALPH, 1923– , *and others.* Stressor effect of hypothermia in the rat. (American journal of physiology, Mar. 1957. v. 188, no. 3, p. 470–72, tables.) 10 refs. *Other authors:* E. J. Fedor *and* B. Fisher.

Hypothermia with ether narcosis for two hrs. caused decrease in weight of adrenals due to loss of water and solids, decrease of their ascorbic acid content and in about one-half of the animals loss of sudanophila and cholesterol and/or esters. No such changes were observed in animals similarly treated for six hrs. nor in rats made hypothermic under Nembutal anesthesia. It is suggested that an initial stress accompanies hypothermia with ether anesthesia. ***Copy seen:*** DLC.

Notes studies and surveys of: fish stocks at Coppermine, the Mackenzie delta region and up the river from Aklavik to Fort Norman; the char run in Rowley River on Rowley Island, Foxe Basin; netting ringed seals at Herschel Island; collection of plankton, benthos and hydrographic samples through a yearly cycle in northern Foxe Basin; etc. ***Copy seen:*** CaMAI.

50905. FISHER, HAROLD, DEAN, 1922– . Fish in the Canadian North. (Canadian geographical journal, Sept. 1958. v. 57, no. 3, p. 96–99, illus., map.) 5 refs.

Reports prospects for exploiting arctic fishery resources. Intensive commercial development for export is not feasible (except at Great Slave Lake), but arctic fish stocks could be of great subsistence value replacing or supplementing caribou and marine mammals as food for the local natives. Such possibilities and a more efficient use of marine mammals have interested the Fisheries Research Board's Arctic Unit since 1947. Development is being considered of local or small-scale commercial fishing, and of a luxury market for arctic char (Eskimo co-operatives, mainly for char fishing at George River and Port Burwell in the Ungava Bay region have been set up according to a government news release, dated June 16, 1959). Greenland halibut, shark and herring fishing may be encouraged. ***Copy seen:*** DGS.

50907. FISHER, R. L., *and others.* Deep-sea bathymetry north of Point Barrow. (Deep-sea research, May 1958. v. 5, no. 1, p. 1–6, map, diagr.) 14 refs. *Other authors:* A. J. Carsola *and* G. Shumway.

Presents a detailed bathymetric chart for a part of the Beaufort Basin approx. 72°30′–76°30′ N. 150°–165° W., and cross-sections of the continental slope north of Pt. Barrow. Procedures are described, and accuracy of the recordings evaluated. Topographic characteristics of the sea-floor area are discussed. A slight rise lies northeast of 74° N. 155° W. The transition from continental slope to flat bottom is abrupt on the northwestern sections; and, from a few isolated spot soundings, the basin seems to extend at least to 76° N. 151° W. The lower continental slope is shown to be a steep scarp (23°) in the area west of the basin, while the gradient of the southeastern flank ranges from 1°9′ to 1°56′. Off the Alaskan coastal plain, southeast of the surveyed area, the upper continental slope is steep, ranging from 4° to 10°. The existence of an isolated area shallower than 500 fm. and centered near 75° N. 158° W., has been established. A broad, flat-bottomed trough which narrows to a steep-walled gap or cleft toward the south, separates this spur from the shallow area to the southwest.

50910. *FISKETS GANG.* Fiskeforsøk med nylon- og perlontorskegarn sammenliknet med garn av vanlig materiale, 3. mars - 13. april 1954. (Fiskets gang, June 10, 1954. årg. 40, nr. 23, p. 290.) Text in Norwegian. ***Title tr.:*** Fishing investigations with nylon and perlon cod nets in comparison with nets of customary materials, Mar. 3–April 13, 1954.

On the Sørøy fishing grounds off western Finnmark in northern Norway, net sections of nylon and perlon yarns were tested. Daily catches of these and sections of customary materials are tabulated: nylon sections had highest catch. Perlon dyed red served better than white.

Copy seen: DLC.

50911. *FISKETS GANG.* Fiskeforsøk med torskegarn av nylon og perlon samfengt, sammenliknet med garn av vanlig materiale. (Fiskets gang, July 29, 1954. årg. 40, nr. 30, p. 369, table.) Text in Norwegian. ***Title tr.:*** Fishing investigations with cod nets of nylon and perlon compared to nets of customary materials.

In net tests on the Båtsfjord fishing grounds off northernmost Norway, the combined daily catch in nylon and perlon nets was higher than that of ordinary nets. Both are tabulated. The white perlon threads were found to wear when knotted.

Copy seen: DLC.

50912. *FISKETS GANG.* Fiskeforsøk med torskegarn av nylon sammenliknet med garn av vanlig tråd. (Fiskets gang, Aug. 5, 1954. årg. 40, nr. 31, p. 384,

table.) Text in Norwegian. ***Title tr.:*** Fishing investigations with cod nets of nylon compared to nets of customary thread.

From tests on the fishing grounds in Varangerfjord, northern Norway, the nylon net catches were found higher; but nylon has not been used long enough to test durability: it has a greater tendency to tear, and repair is more expensive than for hemp nets. ***Copy seen:*** DLC.

50913. ***FISKETS GANG.*** Nytt i organiseringen av uer-industrien; et verdifullt tiltak av Murmansk-fiskerne. (Fiskets gang, July 1, 1954. årg. 40, nr. 26, p. 329.) Text in Norwegian. ***Title tr.:*** News in the organization of the haddock industry; a worthwhile enterprise of the Murmansk fishermen. Based on article in *Pravda*, May 21, 1954.

A new haddock field, the Kopytov of 400–500 mi.,^{2} was discovered in the Barents Sea in 1954 by two Murmansk fishing captains. To lose no time, the fishing boats transfer the catch: the fish are deposited in floating bags marked with buoys, collected then by a transport vessel and cleaned, etc. Difficulties encountered in the enterprise are discussed. Haddock migration routes are little known. ***Copy seen:*** DLC.

50914. ***FISKETS GANG.*** Selfangst- og håkjerringfiske i 1953. (Fiskets gang, Jan. 28, 1954. årg. 40, nr. 4, p. 51–52, 2 graphs, 2 tables.) Text in Norwegian. ***Title tr.:*** Sealing and Greenland shark fishing in 1953.

Activities of the Norwegian sealers in northern waters are summarized. Number of ships, gross and net tonnage, personnel, trips, and gross catch decreased in 1953, after post-war increases to 1952. Greenland seal (from Newfoundland, Greenland straits and the West, North and East Ice) constituted 82% of the yearly catch, which ranges from March to May. Catch of various products, number and duration of trips, tonnage disposition and declared value are tabulated for individual fields. Troms province led in number of sealing ships. ***Copy seen:*** DLC.

50915. ***FISKETS GANG.*** Småtrålerne. (Fiskets gang, July 1, 1954. årg. 40, nr. 26, p. 327–28, 3 tables.) Text in Norwegian. ***Title tr.:*** The small trawlers.

Investigations were made in 1952 and 1953 of economic factors affecting trawlers under 300 tons gross. Costs and earnings are tabulated for three size classes for spring and fall trawling seasons of eight-nine weeks each. Spring trawling appears more profitable than fall. Both vary from year to year and within size classes. Weekly and total seasonal wages, seasonal outlays, and earnings on trawler investments are compared. ***Copy seen:*** DLC.

50916. ***FISKETS GANG.*** Stortrålernes lønnsomhet 1952–53. (Fiskets gang, Oct. 7, 1954. årg. 40, nr. 40, p. 485–87, 3 tables.) Text in Norwegian. ***Title tr.:*** The large trawlers' earnings 1952–53.

Full-time operation is considered for ten Norwegian trawlers in 1952 and twelve in 1953. Amounts of salted and fresh fish varied with years and individual vessels. The 1952 catch was from east and west of Nordkap along the Norwegian coast, the Barents Sea, West Greenland, and Bjørnøya waters with best results from early tours to West Greenland. The same fields were used in 1953, but both catch and prices were lower than in 1952. Data are given on costs, number and duration of trips; also on crew and corporation earnings, etc.; comparisons are made for years 1949–1953. ***Copy seen:*** DLC.

50917. FITZGERALD, GERALD, 1898– . New tools for mapping in arctic Alaska. (Canadian surveyor, July 1957. v. 13, no. 8, p. 484–90, illus., map.)

Reviews the Brooks Range Project: mapping of the area (120,000 sq. mi.) north of 66° N. approx. 141°–163° W., rough terrain, mountains to 10,000 ft., inaccessible, population less than 1/100 sq. mi. "New techniques, hitherto untried in a job of this magnitude, were involved" throughout the project. U.S. Geological Survey operations 1955–56 for production of standard topographic maps at scale 1:250,000 with (mainly) 200 ft. contour intervals are described. The aerial photography was carried out (by Mark Hurd Aerial Surveys of Minneapolis) from 30,000 ft. altitude; 10,300 mi. of transverse low-oblique, and 1,300 mi. of convergent. low-oblique photographs were obtained (the two methods are illustrated), also, in 1956, photographs were obtained of approx. 1,200 mi. south of the original project area. Films were processed at Fairbanks upon completion of each day's work. The phototrig transverse method was applied in the field operations, which were carried out with extensive use of aircraft and helicopters.

Concurrently with the transverse lines, the three field parties ran altimeter lines by the leap-frog method; 352 marked phototrig transverse stations and 433 altimeter elevations were established. Bridging and compilation methods used in assembling the material are described; the maps are scheduled for completion by 1960. ***Copy seen:*** DLC.

50918. FITZSIMMONS, THOMAS, *Editor.* RSFSR, Russian Soviet Federated Socialist Republic. Contributors: Clifford R. Barnett, and others. New Haven, Human Relations Area Files, 1957. 2 v. (xii, 681 p.) illus., 11 maps, tables. (Country survey series.) 150 refs.

Handbook on the history, population, administration, economic and social conditions, industry, transportation, etc., of the dominant Soviet Republic which comprises all the northern areas of the U.S.S.R. The chapter on *Ethnic groups and languages* (p. 85–116) contains information on the distribution, racial affinities, vital statistics, and economy of minority groups, including: Lapps, Zyryans, Samoyeds, Ostyaks and Voguls, Yakuts and Dolgans, Tungus (Eveny and Evenki), Yukaghirs, Chukchis, Koryaks, Kamchadals, Aleuts, Golds, and Gilyaks. Shamanism is mentioned (p. 575–76) as still practiced by some of the herding and fishing tribal groups. Forced labor and concentration camps are dealt with (p. 206–221); they are located mainly along the White and Barents Seas, in the Vorkuta coal region, the Nenets and Khanty-Mansi National Districts, and in the industrial areas of north and northeast Siberia. Population density, distribution of minority groups, administrative divisions, agricultural growing seasons and crop production, natural resources and major industrial regions, transportation system (rail, water, air, highways) are mapped. A geographical and topical index and a glossary of Soviet terminology and abbreviations are appended.

50919. FIZHENKO, V. V. Shchelochnye granity Belykh tundr. (*In:* Akademiia nauk SSSR. Kol'skiĭ filial. Shchelochnye granity Kol'skogo poluostrova, 1958. p. 117–26, illus., tables, diagrs., fold. map.) Text in Russian. ***Title tr.:*** Alkaline granites of the Belyye tundras.

Describes the massif and related basic rocks of Panskiye Vysoty, about 100 km.^{2} in area, east of the Tsaga River and west of Churozero Lake (approx. 67°30′ N. 36° E.). Occurrence of alkaline granites, reported by A. A. Polkanov in 1925, has been studied since by various scientists whose work is reviewed. Petrographic descriptions of the alkaline granites of Belyye tundras, (67°25′–42′ N. 35°25′–36°25′ E.), and gabbro-norites of Panskiye Vysoty are presented in turn and their texture features, component minerals, mode of aggregation, and other characteristics are briefly outlined. Geologic development is treated in common. Special attention is given to the interpenetrating contrast between alkaline granites and basic gabbro-norites. The mode of transformation in the rocks is discussed although metasomatic processes were not observed. ***Copy seen:*** DLC.

50920. *FIZKUL'TURA I SPORT.* Zdorov'e, bodrost', dolgoletie. (Fizkul'tura i sport, Dec. 1958. god 28, no. 12, p. 14–16, illus.) Text in Russian. ***Title tr.:*** Health, high spirits, longevity.

A photo reportage on ice-water bathing and snow rubbing, as a sport indulged by young and old all over the U.S.S.R. The beneficial health aspects of this form of hardening especially for functional disorders of the nervous system, respiratory and circulatory diseases, etc., are stressed. ***Copy seen:*** DLC.

50921. FJELLSTRÖM, PHEBE. Två silversamlingar från Lappland. (Norrbotten. Norrbottens läns hembygdsförening. Årsbok 1958, p. 59–72, illus.) 5 refs. Text in Swedish. ***Title tr.:*** Two silver collections from Lapland.

Contains notes on a collection assembled by Einar Wallquist, Arjeplog (about 90 items), and another acquired by Erland Ström, Jokkmokk (about 182 items) and donated to Norrbotten Museum in 1955. The Lapps used to invest their assets in silver objects bought from Swedish and Norwegian silversmiths. Some of these (drinking-cups, spoons, ornaments for belts and collars, etc.) are described. The decoration on the silver objects was based on Lappish handicraft designs. ***Copy seen:*** SPRI.

50922. FJØRTOFT, RAGNAR. The problem of the maintenance of the low-level anticyclonic circulation in the Arctic. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958, p. 87–92, maps.)

The dynamics of the normal surface pressure in the Arctic during November

in relation to the 700–1000 mb. thickness and the fields of vertical motion and horizontal divergence are discussed. The results suggest that the anticyclonic circulation which predominates in low levels during the arctic winter is maintained essentially by the normal flow and temperature patterns which cause the air masses to be deflected in such a way to give a net warning by advection in the regions surrounding the arctic anticyclone, thus causing the air in the middle to descend and spread at the ground.

Komissiia po izucheniiu chetvertichnogo perioda. Trudy, 1955. t. 12, p. 121–28, illus.) 4 refs. Text in Russian. ***Title tr.:*** Basic features of formation of Quaternary mammalian fauna in the Northern Hemisphere. Paper presented to the Conference on the Quaternary, Moscow, Jan. 13–16, 1953.

Main stages of development of mammals in the Miocene, Pliocene, Pleistocene, and present periods in the tropic, temperate and arctic regions are treated. Special attention is given to the evolution

of the Cervulinae, Cervinae and Odocoileinae. The successive developmental stages are outlined. The end of the Pliocene was characterized by the extinction of several mammals, changes of areas, and the disappearance of warmth-loving forms. At the beginning of the middle Pleistocene there was a wide distribution of contemporary arctic and subarctic mammals, among them, the mammoth, white bear, muskox, polar fox, rhinoceros; the end of this epoch was characterized by the extinction of many mammals and by the survival and adaptation of present forms. Further investigations of mammals are indicated.

Inadequacy of data is the basic problem, due mainly to logistic difficulties (cited) in this area. Three of the important forecasting problems for aviation are outlined: middle-cloud forecasting, i.e. cloudiness between 10,000 and 20,000 ft.; local terminal prediction of ceilings, visibilities, and strong surface winds (examples in Alaska cited), and prediction of upper winds. Recent studies on the last are cited and Kochanski's and D. E. Martin's results are summarized.

Account of the last invasion of the United States by glacier ice on the basis of dating by Carbon 14; and a time chart showing the "path of the glacier's edge as timed by the radiocarbon calendar." ***Copy seen:*** DLC.

50932. FLOHN, HERMANN, *and* **G. SEIDEL.** Recent studies on the arctic troposphere and its teleconnections. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958, p. 62–70, maps, graphs.) 7 refs.

The studies are based on mean 500–1000 mb. thickness charts for the area 75°–90° N. during each winter from 1949–50 to 1955–56, and on the area covered by an "arctic air mass" with a thickness of less than 5000 gpm. The average tropospheric temperature of the Central Arctic shows strong irregular time variations between Nov. and March which cannot be explained by seasonal changes of radiation balance. A regular balance between this temperature and the strength of the mid-latitude westerlies, as hypothesized earlier, was not found. A relationship was found, however, between the so-called area of arctic air over Siberia, and the average zonal wind component at the 500-mb level over Europe, with a delay of about one week. ***Copy seen:*** DLC.

50933. FLOHN, HERMANN. Zur Frage der Einteilung der Klimazonen. (Erd-

kunde, Aug. 1957. Bd. 11, Heft 3, p. 161–75, 3 maps, tables.) 50 refs. Text in German. Summary in English. ***Title tr.:*** The problem of a classification of climatic zones.

A factual (descriptive) classification of climates should be supplemented by genetic classification, restricted however to the major climatic zones. The genetic classification of B. P. Alisov (No. 27751) based on air masses and their fronts is compared with the author's, based on wind and precipitation fields; the two are found in general agreement. According to Alisov's map and Flohn's explanation, the polar climates fall into subpolar and polar zones. The former, limited by the position of the polar front, is found only between 70° N. 10° W. and 67° N. 75° E. The arctic and (especially) antarctic zones are mainly characterized by yearly radiation balance and permanent ice cover. The regime of winds, appearance of temperature inversion, maritime and continental climate in the Arctic are discussed. ***Copy seen:*** DLC.

FLORENSOV, N. A., *see* Puchkov, S. V., *and others.* Novoe sil'noe zemletrîasenie . . . *1958.* No. 54165.

50934. FLORIN, RUDOLF. On Jurassic taxads and conifers from northwestern Europe and eastern Greenland. (Acta horti bergiani, 1958. bd. 17, no. 10, p. 257–402, 6 illus., 56 plates.) 121 refs.

Includes descriptions of the stratigraphy of the plant-bearing series of Scoresby Sund, East Greenland, belonging to the Cape Stewart formations (fresh-water Lower Lias and Rhaetic), and the beds adjacent. The Scoresby Sund floras contain remains of many conifers or conifer-like plants (p. 345–49), of which three are discussed: *Storgaardia spectabilis, Elatocladus amblus* and *E. punctatus.* The rest of the paper deals with Jurassic flora of European localities.

50935. FLOVIK, KARL. Chromosome numbers and polyploidy within the flora of Spitsbergen. (Hereditas, 1940. bd. 26, häfte 3–4, p. 430–40.) 22 refs.

In the 68 higher plants studied, 14 are diploids and 54 (approx. 80%) polyploids. This agrees with others' finding that a high percentage of polyploids is common in a region of adverse climatic conditions. Several instances of intraspecific chromosome races were met. In most cases the high chromosomal race has the most northern range of distribution, but there are also examples of the reverse.

50936. FLOVIK, KARL. Cytological studies of arctic grasses. (Hereditas, 1938. bd. 24, häfte 3, p. 265–376, 104 illus., plate.) 179 refs.

Of 26 species and varieties studied, chiefly from Spitsbergen, all have secondary constrictions in all or most of the chromosomes of the somatic complement; the original basic chromosome number in the fam. Gramineae is of 5 units: an hypothesis of an original basic number of 12 units advanced by Avdulov is criticized. Only one grass, viz. *Puccinellia vahliana,* is diploid. In the genus *Dupontia,* the basic chromosome number was found to be 11. The tetraploid *Phippsia concinna* var. *algidiformis* must be regarded as a hybrid between *P. algida* and *P. concinna.* Conclusion is drawn that the viviparous grasses examined should be regarded as allopolyploids. Of the normal, non-viviparous *Poae,* the species *P. alpigena, P. glauca* and *P. arctica* have apomictic seed-formation. ***Copy seen:*** DLC

Basic work on Norwegian fauna, little changed in the last few thousand years. Mammals; birds; reptiles, amphibians, fish; and invertebrates are treated in successive volumes, each containing descriptive accounts of the life forms, extensively illustrated, a systematic appendix with keys to identification, and a register of scientific also common Norwegian names. The descriptive accounts, about a hundred in all, are essays by specialists dealing with the life cycle, habits, reproduction, etc., of the animal or group, its role in nature and its significance for man. Most of the fauna treated have representatives in the far North, and sea mammals, such as seal and whale, are included as important in the Norwegian economy. Among others of arctic interest are chapters on the reindeer, muskox, small rodents in v. 1; and in v. 2, those on eiders, ducks, geese, swan, grebes, cormorants, fulmar, gulls and auks, and papers on bird cliffs, flyways and on birds of Svalbard. The principal fishes of arctic seas, cod, herring, haddock, etc., as well as cold deep, fjord, and fresh-water forms and visitors are surveyed in v. 3. Vol. 4 covers a wide range of invertebrates, spiders, insects, mites, worms, a few crustaceans, etc., also bottom, drifting and fresh-water forms, and fossils. ***Copy seen:*** DLC.

Discusses these protective forests which cover mountain slopes, intervales, and adjacent high altitude areas influenced by mountain climate. Such forests in Jämtland and Härjedalen (growing at 600–900 m.) have been left untouched until recent years, to provide protection against receding of the mountains. Trees and soil regenerated, restricted cutting became desirable. Natural regeneration of pine is adequate in some localities, but some form of artificial regeneration is necessary for spruce.

Introduces hypothesis on the origin of the Canadian Arctic Islands and suggests regional division of the archipelago and its relation to the geologic framework of the continent. Present surface of islands is believed to be the product of erosion, at first taking place on continuous land surface, without interruption by arms of the sea. Subsequent, successive uplift, downwarp, faulting, glaciation, submergence and emergence is postulated. This hypothesis agrees with the geological concept of a continental land mass, and presents a preliminary interrelation of the main physical features of the islands. Substantiating or dispelling this hypothesis as it relates to the sea floor among the islands is work of the hydrographer. ***Copy seen:*** DLC.

50955. FORTIER, YVES OSCAR, 1914– . Old and new ways in arctic geology. (Canadian geographical journal, Sept. 1958. v. 57, no. 3, p. 86–91, illus., maps.)

Describes geological explorations in the Canadian arctic archipelago, from Frobisher's in 1576 to the Geological Survey's in summer 1958. These studies, old and new, indicate that the archipelago is part of the North American continent and that its insularity is very recent. Geological regions have been classified and mapped: the Canadian Shield, Arctic Lowlands and Plateaux, Innuitian Region, and Arctic Coastal Plain. Characteristics of these geological divisions are used as a basis for consideration of mineral resource potential. Occurrences of graphite, iron ore, sulphides, low grade coal and gypsum are mentioned, and speculation made on possible discoveries of copper on Victoria Island and oil and gas in the Innuitian and Arctic Lowlands and Plateaux regions.

Discusses these protective forests which cover mountain slopes, intervales, and adjacent high altitude areas influenced by mountain climate. Such forests in Jämtland and Härjedalen (growing at 600–900 m.) have been left untouched until recent years, to provide protection against receding of the mountains. Trees and soil regenerated, restricted cutting became desirable. Natural regeneration of pine is adequate in some localities, but some form of artificial regeneration is necessary for spruce. ***Copy seen:*** DA.

50946. FORSHELL, WILHELM PLYM. Norrlands skogar under 75 år. (Skogen, *Stockholm,* Mar. 21, 1958. årg. 45, nr. 6, p. 164.) Text in Swedish. ***Title tr.:*** Norrland forests during 75 years.

The Society for Forest Cultivation in Norrland was founded in 1883 and the State Forest Research Institute in 1902, but exploitation continued and productive forests reached an all-time low in the 1930's. A cultivation research program instituted by the state and some private forest owners at that time, together with

mechanization, are largely responsible for the recent increase in forest productivity. ***Copy seen:*** DA.

50947. FORSLUND, BJÖRN. Betong, ett norrländskt industriproblem. (Tidning för byggnadskonst, Nov. 1952. årg. 44, nr. 21, p. 831–33.) Text in Swedish. ***Title tr.:*** Concrete, an industrial problem in Norrland.

Contains brief notes on communication problems and industrial potentials in northern Sweden. The development of the concrete factory K/B Betong in Överluleå is taken as an example of what can be achieved through effective organization and extensive rationalization. Specializing in road-rollers and drainage pipes, the factory is able to cover the demand for them in Norr- and Västerbotten. ***Copy seen:*** DLC.

50953. FORTIER, YVES OSCAR, 1914– , *and* **L. W. MORLEY.** Geological unity of the arctic islands. (Royal Society of Canada. Transactions, June 1956. v. 50, ser. III, p. 3–12, 3 text maps.) 6 refs.

Introduces hypothesis on the origin of the Canadian Arctic Islands and suggests regional division of the archipelago and its relation to the geologic framework of the continent. Present surface of islands is believed to be the product of erosion, at first taking place on continuous land surface, without interruption by arms of the sea. Subsequent, successive uplift, downwarp, faulting, glaciation, submergence and emergence is postulated. This hypothesis agrees with the geological concept of a continental land mass, and presents a preliminary interrelation of the main physical features of the islands. Substantiating or dispelling this hypothesis as it relates to the sea floor among the islands is work of the hydrographer. ***Copy seen:*** DLC.

50955. FORTIER, YVES OSCAR, 1914– . Old and new ways in arctic geology. (Canadian geographical journal, Sept. 1958. v. 57, no. 3, p. 86–91, illus., maps.)

Describes geological explorations in the Canadian arctic archipelago, from Frobisher's in 1576 to the Geological Survey's in summer 1958. These studies, old and new, indicate that the archipelago is part of the North American continent and that its insularity is very recent. Geological regions have been classified and mapped: the Canadian Shield, Arctic Lowlands and Plateaux, Innuitian Region, and Arctic Coastal Plain. Characteristics of these geological divisions are used as a basis for consideration of mineral resource potential. Occurrences of graphite, iron ore, sulphides, low grade coal and gypsum are mentioned, and speculation made on possible discoveries of copper on Victoria Island and oil and gas in the Innuitian and Arctic Lowlands and Plateaux regions.

Contains observations on bird life made on 26 species on Boothia Isthmus, May 28–Sept. 14, 1953; on 25 species on southeastern Victoria Island, May 27–Aug. 28, 1955; and on 32 species on southern King William Island and northwestern Adelaide Peninsula, June 24–Sept. 14, 1956. A list of 20 place names with their coordinates is appended. The bird observations were made incidentally in the course of a geographical survey carried out for the Geographical Branch, Dept. of Mines and Technical Surveys, Ottawa. ***Copy seen:*** DA.

50972. FRASER, J. KEITH. Tracing Ross across Boothia. (Canadian geographer, 1957. no. 10, p. 40–59, 8 illus., 5 text maps.) 11 refs.

Summarizes events of John and J. C. Ross's expedition in the *Victory*, 1829–1833, noting the mapping of southern Boothia Peninsula (70° N. 95° W.) and the north coast of King William Island during nine sledge journeys (cf. No. 14866). Later explorations of Boothia have added little to the Ross's data till 1953, when the author and C. Laverdière (Canadian Geographical Branch) made a spring-summer trip by dog sled, foot and canoe across the isthmus and through lakes north of Spence Bay. Eskimo settlements and movements and geographical features were studied. From this survey, airphoto. map, etc., Ross's nine routes are traced and features named by him are identified and described as seen in 1953. Names (23) adopted by the Canadian Board on Geographical Names, on the basis of 1953 survey are added.

50973. FREBOLD, HANS, 1899– . Fauna, age and correlation of the Jurassic rocks of Prince Patrick Island. Ottawa.

Queen's Printer, 1957. 69 p., 18 plates, text maps, tables (1 fold.) (Canada. Geological Survey. Bulletin 41.) 43 refs.

Study of Jurassic fossils collected by E. T. Tozer in 1954: several species of ammonites and pelecypods are described in detail and illustrated; outcrops, from which fossils were collected are correlated. There are various Lower and Middle Jurassic beds on this island containing interesting and, in part, hitherto unknown faunas. Comparison is made with Jurassic paleontology of other localities in the Arctic and the maximum extent of Jurassic seas estimated. Data available show that several Jurassic transgressions, interrupted by times of regressions, followed one another and that these transgressions apparently varied in extent from place to place.

Includes brief references to arctic and subarctic Canada: map, p. viii, Jurassic localities, regions of marine deposition, etc. ***Copy seen:*** DGS.

50975. FREBOLD, HANS, 1899– . The Jurassic system in northern Canada. (Royal Society of Canada. Transactions, June 1958. Ser. 3, v. 52, sect. 4, p. 27–37, map, table.) 13 refs.

Outlines on the basis of recent fossil collections, the stratigraphy, paleogeography and faunal compositon of Jurassic occurrences in the southern Yukon, arctic coast and Canadian Arctic Islands, especially Prince Patrick, Axel Heiberg and Ellesmere. The sequence of events differed considerably in these various regions. Maximum extent of the Jurassic seas is considered and, tentatively, mapped. Faunistic and stratigraphic correlations are made with other areas. Similarities indicate that the eastern Canadian Arctic Islands belong to the same faunal province as East Greenland and the Barents Shelf, and that the same events occurred in all three regions.

50995. FRISTRUP, BØRGE. Isen og gletscherne skal nu studeres over hele jorden. Er vi atter på vej mod et koldere klima? (Naturens verden, Jan. 1957. årg. 41, p. 1–5, illus.) Text in Danish. ***Title tr.:*** Ice and glaciers are to be studied over the whole earth. Are we heading toward a colder climate again?

Outlines studies planned for the IGY. Changes in the extent and volume of glaciers will be investigated in relation to fluctuations of climate in lieu of meteorological records, and as basis for evaluating future climatic conditions. Position of the ice front, snow accumulation and loss, relative importance of temperature, rainfall, and radiation in the melting process are to be studied, also the influence of various geographic and meteorological factors such as topography, wind direction, and sunshine, on the occurrence of different glacier types. The value is noted of investigating boreholes, annual layers of glacier ice, included layers of identifiable volcanic ash, and the distribution of impurities in relation to industrialization. Glaciers beyond the inland ice of Greenland are to be studied in Inglefield Fjord and Upernavik Island, in Graedefjord (south Greenland), on Angmagssalik and Clavering Islands, also at a station on the north coast.

Copy seen: DLC.

50996. FRISTRUP, BØRGE. Thule distriktet. (Kulturgeografi, Apr. 1958. årg. 10, no. 57, p. 25–38, illus., maps.) Text in Danish. Summary in English. ***Title tr.:*** The Thule District.

Describes the culture of the Polar Eskimos, inhabiting the North Greenland from Holms Ø in Melville Bugt to Humboldt Gletscher north of Inglefield Land. Outsiders' influences upon this nomadic hunting people and modifications in their living patterns are traced from the first settlement of the district about 1000 years ago. In 1953, the people at their main settlement, Thule, were transferred to a new location because of the construction of an American air base at the old site.

First systematic description of type section of the Williams Island formation (Middle Devonian, next above the Sextant formation and Abitibi River limestone; cf. No. 3478), located 2 mi. north of Long Rapids on the Abitibi River (approx. 50°15′ N. 81°40′ W.). Field work was carried on by the junior authors, 1950–1953; stratigraphic and paleontological research by all three. Well-preserved coral fauna found at the base of the type section are described in detail and illustrated on the plates. Consideration of the corals and stratigraphic evidence lead to conclusions that Williams Island formation is Hamilton in age (Middle Devonian). ***Copy seen:*** DGS.

50999. FRITZ, SIGMUND. On the "arctic whiteout." (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958, p. 182–86, diagrs.) 7 refs.

Basic requirements for the occurrence of this phenomenon are noted, and a mathematical model is established to define it. The results indicate that a surface albedo of 0.6 is a value below which whiteout cannot occur. The theoretical conclusions cannot be conclusively tested until more observational data are available. ***Copy seen:*** DLC.

51000. FRITZ, SIGMUND. The "polar whiteout." (Weather, Nov. 1957. v. 12, no. 11, p. 345–48, graph.) 8 refs.

Discusses ground and sky conditions leading to the whiteout: it can occur only when surface reflectivity, R, is greater than 0.6, but the actual lower limit of reflectivity, greater than R = 0.6, at which the whiteout would *not* occur, is uncertain. Devices such as the so-called "snooperscopes" are suggested to make objects visible. W. T. Roach adds a note on infra-red radiation in whiteout conditions, to which Fritz replies (p. 348–49).

51001. FRITZ, SIGMUND. Solar radiation measurements in the Arctic Ocean. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958, p. 159–66, diagrs.) 6 refs.

Measurements of sun and sky radiation on a horizontal surface made on the ice island T–3 during 1953 are summarized and compared with similar data obtained in the Antarctic and in middle latitudes. Energy received on overcast days in midsummer was similar to that measured in the Antarctic. The fraction of the extraterrestrial energy transmitted to the ground is greater in the Arctic than at Washington, D.C. This may be explained by the higher surface albedo in the Arctic or differences in cloud properties. Energy utilized in melting snow and ice is estimated, and possible explanations for the loss of the remaining energy are advanced. ***Copy seen:*** DLC.

51002. FROESE, GERD. Effect of breathing O_2 at one atmosphere on the response to cold in human subjects. (Journal of applied physiology, July 1958, v. 13, no. 1, p. 66–74, illus., table.) 12 refs.

"The average decrease in O_2 consumption when breathing O_2 was 19.7 cc./min./m^2., which represented 30% of the mean increase in O_2 consumption in the cold and was significantly different from zero ($P<0.001$)." Breathing O_2 also resulted in lower heart rate, lower volume increase due to cold, lower respiratory frequency and EMG. ***Copy seen:*** DLC.

51021. FUHRMAN, FREDERICK A. Experimental frostbite; effect of brief freezing and burning on tissue loss following standard frostbite in the rat. (Journal of applied physiology, Jan. 1957. v. 10, no. 1, p. 139–42, tables.) 12 refs.

Account of investigation on the effects of brief freezing or burning upon the effects of freezing provoked 48 hrs. later. Preceding freezing decreased tissue loss in the same leg from subsequent frostbite, but not in the contralateral leg. The same effect was observed in adrenalectomized animals. Brief burning had a similar effect on subsequent frost injury. ***Copy seen:*** DNLM.

51022. FUHRMAN, FREDERICK A. Experimental frostbite; oxygen consumption and anaerobic glycolysis of rat tissues after freezing and cooling in vitro (Journal of applied physiology, Mar 1957. v. 10, no. 2, p. 224–30, tables.) 30 refs.

Account of experiments with tissue slices and homogenates of skin, skeletal muscle, nerve, brain, and liver. In general, impairment of metabolism increased with decrease in temperature and with prolongation of the frozen state. However, the metabolism of skin was considerably more resistant to freezing than that of the other tissues. The bearing of these observations on the problem of frostbite is discussed. ***Copy seen:*** DLC.

51023. FUHRMAN, FREDERICK A., *and* **G. J. FUHRMAN.** Metabolism of skin following frostbite. (Journal of applied physiology, July 1957. v. 11, no. 1, p. 45–50, illus., tables.) 27 refs.

Account of investigation on skin of rats. The longer feet were frozen at −25° C. the greater was the tissue loss and the lower the Qo_2 and $Q_{O^2}^{N^2}$. The sum of freezing-thawing and post-thawing injury to skin respiration was 90 percent and damage present at thawing was even larger. Rapid rewarming reduces tissue loss by reducing freezing-thawing damage;

this represents a specific effect and not merely a shortening of the frozen state.

51024. FUHRMAN, FREDERICK A., *and* G. J. FUHRMAN. The treatment of experimental frostbite by rapid thawing; a review and new experimental data. (Medicine, Dec. 1957. v. 36, no. 4, p. 465–87, illus., tables.) 91 refs.

An historical review of the use of cold and heat in the treatment of frostbite, including rapid thawing of frozen extremities. The most effective of the latter method is considered to be immersion in water of 42±2° C. till the affected part attained normal temperature. Immersion soon after thawing is also of some benefit. Rapid rewarming is most effective after brief frostbite. It shortens the duration of the frozen state and tissue damage by high electrolyte concentration. ***Copy seen:*** DLC.

The results of brief measurements in the Sea of Okhotsk on the motion of sea ice relative to the surface water as caused by wind are presented, and a model of steady ice drift in a sea with any percentage of ice and a steady wind-driven oceanic current is discussed theoretically. The principal difference between the proposed theory and those of other investigators is that the drift of ice on the sea with any ice area ratio and the effects of wind pressure or water resistance on the lateral boundary or on hummocked ice are considered here. Practical applications of the theory to the results of Nansen's observations on ice drift in the Arctic Ocean and to the monthly variations of drift-ice distribution on the Sea of Okhotsk are discussed.—From SIPRE. ***Copy seen:*** DN–HO.

In the subjects taught (details given), the emphasis is on teaching methods and on training for general cultural work. A short historical survey is included of this college, founded at Godthåb in 1847. ***Copy seen:*** DLC.

51036. GAD, FINN, 1911– . The language situation in Greenland. (Danish Foreign Office journal, Mar. 1957. no. 22, p. 15–18, 6 illus.)

Eskimo language study has centered in West Greenland from the time of Hans Egede, 1721; and the West Greenland dialect has prevailed, alone, as long as its range suited the local life. But 20th century conditions, changes in political status, and the strategic position of Greenland, especially since the 1930's, have demonstrated the limitations of the Eskimo and the need for the Danish language. Introduced activities as fishing, sheep-farming and an industrial culture generally have concepts not expressible in the dialect. The first four bilingual schools have been set up under the 1950 Greenland Education Act, and the largest journal, *Atuagagdliutit*, also several small weeklies are published in both Danish and Eskimo. ***Copy seen:*** DLC.

Review of the literature and of the problem, introduces discussion of author's work on rats and guinea pigs, cold exposure and administration of ascorbic acid serving as conditioning factors. Phenomena observed in response to cold were as follows: cold exposure of hypophysectomized rats treated with ACTH, increased adrenal response to the latter. Adrenal response to ACTH increased by ascorbic acid administration is not further increased by cold-exposure. Cold exposure or vitamin C administration raises the thyroid response to thyrotropin in hypophysectomized rats, but the combination of both does not increase this

response. Cold exposure slightly activated the thyroid in scorbutic guinea pigs; this action is prevented by administration of vitamin C. ***Copy seen:*** DNLM.

51041. GAĬGEROV, S. S. Atmosfernye profsessy v tsentral'noĭ Arktike. (Priroda, Dec. 1957. no. 12, p. 27–34, illus.) Ref. Text in Russian. English translation by E. R. Hope issued as Canada. Defence Research Board. Directorate of Scientific Information Service. Translations, T282R, Mar. 1958. 13 p. Copy at CaMAI. ***Title tr.:*** Atmospheric processes in the Central Arctic.

Contains a popular account of aerological observation procedures during 1955–56 at the drifting station North Pole–4, using radiosondes and radiotheodolites, and preliminary analyses of some of the collected data on temperature, wind, etc., in the lower stratosphere. Conditions for development of cyclones, also prevailing pressures, extent of cloudiness, etc., during cyclones and anticyclones, their frequency, direction of movement (mostly northerly during this period) are discussed. Fluctuations in the height of the tropopause were found to be greatly influenced by cyclonic activity; the tropopause exhibited a marked temperature inversion during the summer (May-Aug.). An example of a vertical section of the atmosphere is illustrated, also one of temperature distribution with height. Dependence of temperature-stratification on the absorption of solar radiation by atmospheric-ozone is discussed. ***Copy seen:*** DLC.

51042. GAĬGEROV, S. S. K rezul'tatam aėrologicheskikh nablīudeniĭ na dreĭfuīushcheĭ stantsii "Severnyĭ polīus–4" v 1955/56 g. (Meteorologiīa i gidrologiīa, Oct. 1957, no. 10, p. 3–9, tables, graph.) 7 refs. Text in Russian. English translation available. ***Title tr.:*** On the results of aerological observations at the drifting station North Pole–4 during the year 1955/56.

Reports on 12 months' continuous observations by radiotheodolite in the Arctic Basin, and presents some preliminary results of *in situ* analyses of the data. Little seasonal fluctuation in the height of the tropopause is shown in data at North Pole-2, -3 and -4, maximum heights occurring in the winter season; corresponding temperatures are tabulated, and their dependence on the height of the sun is discussed. Minimum temperature, −81.2° C., was observed at 20 km. height on Jan. 4, 1956; an example of temperature variation with height is graphed. The strongest winds were observed in the upper troposphere, velocity decreased rapidly with height. Other, more complex questions of the general regime of temperatures, winds, etc., above the Central Arctic, to be studied during the IGY, are outlined. ***Copy seen:*** DLC.

51043. GAJDA, ROMAN T. Cryoconite phenomena on the Greenland Ice Cap in the Thule area. (Canadian geographer, 1958. no. 12, p. 35–44, illus., maps, tables.) 31 refs.

Discusses observations, 1949, in the ablation zone of the icecap in northwest Greenland (76°34′ N. 68°15′ W.). Quantitative data on the morphological characteristics of cryoconite holes is presented, and relationships between their sizes, width and depth are examined. Of 90 holes measured, the majority were from 2 to 15 cm. wide and 10 to 20 cm. deep, 80% were circular, and all had vertical straight walls. Depth of holes increased with distance from the ice margin because increased direct ablation near the margin overcomes the effects of the cryoconite ablation. These holes were not as deep as some measured 6° to the south by Drygalski 58 years earlier, possibly due to the long-range cycle of warming in the Arctic. Cryoconite stripes and surface coating are described, also observations of the effect of particle size and layer thickness on melting. Practical applications of the role of cryoconite in melting processes are considered, and possibilities of artificial dusting of snow and ice surfaces to speed up thawing.

Describes the features of the sloping rim of Arctic Basin between the northern edge of the shallow arctic shelf seas and southern limit of the central abyssal area. The geomorphic structure of the bottom of this slope affects the currents, tides, ice drift, ice pressures, formation of open-water pools and polyn'yas; this influence is discussed also in relation to heat exchange, evaporation, fog formation, aeration of water masses and air circulation (frequency of cyclones). The area of this slope may be regarded as a separate zone or "landscape" with its own hydrological, climatic and biological conditions; more favorable for development of life than other parts of the arctic seas, with greater abundance of microorganisms, fishes, sea mammals, birds and polar bears, this ring is justly called the "life ring" of the Arctic Basin. The narwhal (*Monodon monoceros* L.) is mentioned as typical of its fauna. Bathymetric, oceanographic, glaciological aerological and biological work of recent expeditions (including Eastern High Latitude Expedition on the ice-breaker *Severnyĭ Polîûs* in 1946, High Latitude Expedition on the *Litke* in 1955, and Greenland Sea Expedition on the ice-breaker *Ob'* in 1956) is noted.

Text in Russian. ***Title tr.:*** Scientific work in the Arctic: the High Latitude Oceanographic Expedition to the northern part of the Greenland Sea.

Broad studies were made during the summer of 1956 on the diesel-electric ship *Ob'*, in the region of Nansens Rise in view of effects of Arctic and Atlantic current exchange on the Northern Sea Route: the investigations of Russian, Swedish and Norwegian scientists in oceanography, microbiology, geology, meteorology, geophysics, etc., are described. En route to the Greenland Sea, the party carried out supplemental observations (by helicopter) on the icecap on Nord-

austlandet, also work on currents, ice-drifts, abyssal sediments and bottom relief. The Greenland Sea was investigated up to 82°51′ N. with bottom relief soundings and water sampling. The results are briefly outlined with comparison of data from (stations at 30-mile intervals) cold waters off East Greenland and the warm current off Spitsbergen. ***Copy seen:*** DLC.

51049. GAKKEL', ÎÂKOV ÎÂKOVLEVICH. Nauka i osvoenie Arktiki; k sorokaletiiû sovetskikh issledovaniĭ. Leningrad, Izd-vo "Morskoĭ transport," 1957. 133 p. illus., ports., maps. Text in Russian. ***Title tr.:*** Science and the conquest of the Arctic; forty years of Soviet exploration.

In two parts, the first (p. 11–76) reviews results of work, mainly in the post-war period: the High Latitude expeditions, drifting and coastal stations (p. 30–40); meteorological (Central Arctic), oceanographic and glaciological studies, weather and ice forecasting for navigation (p. 40–51), biological, mineral resource, geomagnetic and ionospheric investigations (p. 51–64); cartographic and hydrographic work, geographic discoveries (p. 67–76). In pt. 2 (p. 77–132), some new problems are discussed: the submarine Lomonosov Range (p. 79–95); continental shelf (p. 96–104); terrestrial energetics (p. 105–124); paleogeography (p. 125–28); IGY (p. 129–32). Resource development is stressed as the central problem. The chief organizations and expeditions engaged in research and development are noted, as are successes in prospecting for coal, nonferrous ores and other minerals; new methods of exploration are discussed. Scientists and others who have contributed significantly to this work, particularly in recent years, are cited. Discovery of a volcano in the Lomonosov Range at 88°.3 N. 65°.3 W., emitting sulfuric gas on Nov. 24, 1954 is claimed for the drifting station North-Pole-3 (p. 89–92). The second magnetic pole postulated by Prof. B. P. Veĭnberg is disclaimed on the basis of recent investigations. Distribution of geotectonic, geomagnetic and geochemical forces in northern regions and the existence of "critical" meridians (105° E. and 75° W.) and parallels (62° N.) are discussed; the similarity of "energetistic centers" at their intersections in Siberia (Anabar Plateau) and in Canada is noted. The diamond discoveries in Yakutia have scientific significance; possibility of diamonds also in Canada is suggested (p. 114–18). Numerous text maps include Soviet landings in Arctic Basin (p. 31), scheme of distribution of diurnal maxima of geomagnetic disturbances (p. 61) and bathymetry of the Basin, 1954 and 1955 (p. 107–108).

Lists seven insects which destroy 70–90% of the cabbage, onion and other vegetable crops in the lower Ob, Yenisey, Lena and Kolyma basins. They are: *Chortophila floralis* Falln., *Plutella maculipennis* Curt., *Aclypea opaca* L., *Pegomyia hyosciami* Panz., *Chortophila antiqua* Meig., *Eurydema dominulus* subsp. *dahurica* Motsch. and *Entomoscellis adonidis* Pall. The periods of appearance are noted; dusting with 12% hexachloran is recommended as the best method of control. ***Copy seen:*** DLC.

51055. GALBRAITH, JOHN S. The Hudson's Bay Company as an imperial factor, 1821–1869. Berkeley, University of California Press, 1957. 500 p. maps incl. 1 fold.

Exposition of the political implications involved in the growth, consolidation and decline of the Hudson's Bay Company's fur trade, illustrating the contribution of business men to the shaping of British foreign policy and Empire expansion. The Company's claims to vast territories in North America were challenged, at times involving the British government in diplomatic negotiations. The Company strongly influenced negotiation of the Anglo-Russian treaty of 1825, which set the boundary between Southeast Alaska and Canada. Relations with the Russian American Company are described; also the neutrality agreement between the British and Russian governments during the Crimean War, safeguarding the interests of these two fur-trading monopolies on the North Pacific coast. Extensive bibliographic references are included.

51057. GALCHENKO, INNOKENTIĬ IVANOVICH. My idem na sever; zapiski geologa. (Na severe dal'nem, 1955, vyp. 2, p. 22–65.) Text in Russian. ***Title***

tr.: We head north; sketches by a geologist.

In 1934–35, the author participated in the Upper Kolyma Geological Expedition of Dal'stroĭ, led by V. A. TSaregradskiĭ; and the next year he led a party making explorations of the Ulakhan Chistyy plateau (approx. 64°–65° N. 145°–148° E.) on the upper reaches of Rossokha, Omulevka (tributaries of the Kolyma) and the Nera (tributary to the Indigirka). The events of the trip are sketched: travel on horseback in the wild mountain taiga; transport of equipment by horse and reindeer sled; help rendered by the local Tungus and Yakuts; encounter with bears, elk, wild sheep; discovery of rich (gold?) placers at various (unidentified) creeks, etc. The party reached Nagayeva Bay on the Okhotsk Sea coast late in the fall. ***Copy seen:*** DLC.

51058. GALIŪK, V. A. Novye dannye o geologii i mineralogii Ėmel'dzhakskogo flogopitovogo mestorozhdeniîa, IŪzhnaîa IAkutiîa. (Moskva. Moskovskiĭ geologo-razvedochnyĭ institut. Trudy, 1957. t. 31, p. 102–129, illus., tables) 7 refs. Text in Russian. ***Title tr.:*** New data on the geology and mineralogy of the Emel'dzhak phlogopite layers, southern Yakutia.

Presents main results of three years' investigation (sponsored by the "Sibgeolsliūda" and "Aldansliūda" trusts) of phlogopite layers found prior to 1941, 70 km. southeast of the town of Tommot. Stratigraphy and structure of the region, formation, and mineral composition of phlogopite bodies, their occurrence in veins, problems of bedrock metamorphism are outlined, and the genesis of phlogopite and associated minerals is discussed. Special attention is given to its properties; the phlogopite bodies of Emel'dzhak are rich in aluminum and iron.

51072. GAMBLE, S. G. Mapping of the Ungava Peninsula. (Photogrammetric engineering, June 1958. v. 24, no. 3, p. 410–14, map.)

In mapping of this mineral-rich area of Northern Quebec, the Topographic Survey of Canada assesses new survey and photogrammetrical techniques (cf. No. 50917) in a large practical test. The environment is described with emphasis on mapping conditions. Initial planning and surveys, 1955–1957, are outlined. Application of electronic instruments included Shoran for geodetic control, radar altimeters for vertical control and horizontal scale, tellurometers (adapted in 1957) for secondary survey control and for establishing scale on selected flights.—From author's abstract. Fourteen standard topographic series maps at scale 1 : 250,000 with 100 ft. contours are to be produced for the area from 58° N. to Hudson Strait and from 71° W. to the east shore of Hudson Bay; also more detailed (1 : 50,000 with 50 ft. contours) mapping of 9,000 sq. mi. of the mineralized zone Wakeham Bay-Mosquito Bay. Aerial photography (from 20,000 ft.) and radar altimeter profiles were taken simultaneously. The survey is scheduled for completion by 1958. ***Copy seen:*** DLC.

Contains description, discussion and illustrations of these cliffs, considered result of the abrasive action of the sea. Such chimney-cliffs are numerous on the western coast of the Okhotsk Sea, especially in the region of the Shantarskiye Islands. The influence of the irregular shoreline and geological structure of the coastal rocks upon the development of such cliffs is noted and discussed. ***Copy seen:*** DLC.

51078. GANJU, S. N., *and* **M. F. LOCKETT.** The effect of thyroid hormone on the resistance to cold, and on the oxygen consumption of adrenalectomized and thyroidectomized mice. (Journal of physi ology, Sept. 30, 1957. v. 138, no. 2, p. 44P–45P.)

Summary of varied and numerous experiments indicating *inter alia* that thyroidectomized-adrenalectomized, salt-maintained mice show shorter survival time in the cold than controls and than similar, only adrenalectomized mice. O_2-consumption is reduced by 25% one week after adrenalectomy or thyroidectomy. ***Copy seen:*** DNLM.

51079. GANT͡SKAĬA, O. A., *and* **N. ĬA. MERPERT.** Issledovaniĭa sovetskikh arkheologov i ėtnografov. (Akademiĭa nauk SSSR. Vestnik, June 1958. god 38, no. 6, p. 125–28.) Text in Russian. ***Title tr.:*** Research activities of Soviet archeologists and ethnographers.

Reviews reports of 1957 field work presented at the Apr. 7–12, 1958 session of the Dept. of Historical Sciences of the Institute of the History of Material Culture and the Institute of Ethnography of the Academy of Sciences of U.S.S.R. Mentioned among others are the papers of: B. O. Dolgikh on the development of the economy and culture of the small peoples of the North; M. M. Gerasimov on the stone age sites of Mal'ta which revealed the partitioning of dwellings into men's and women's quarters, and the discovery of two mesolithic culture horizons at Ust' Belaya, on the lower course of the Belaya, a tributary of the Angara River. M. G. Levin reported on the excavation of a burial at Uelen, Chukotka, that revealed a skull with pronounced old-Eskimo traits, the only one as yet found on the Asiatic shore. G. F. Debet͡s reported on his studies (at the Museum of Natural History, New York) of the anthropological types of Eskimo specimens from Ipiutak and Tigara collecteed in 1939–1941 at Point Hope by F. Rainey and H. Larsen; Debet͡s is of the opinion that the Tigara type is identical with that of the present-day Eskimo, while the Ipiutak, though belonging to the greater Mongoloid race, shows various substantial differences (not elaborated upon). ***Copy seen:*** DLC.

51080. GANT͡SKAĬA, O. A., Sessii, posvi͡ashchennye itogam ėkspedit͡sionnykh issledovaniĭ 1957 g. (Sovetskai͡a ėtnografiĭa, 1958, no. 5, p. 128–32.) Refs. Text in Russian. ***Title tr.:*** Sessions, dealing with the results of expeditionary investigations in 1957.

Contains abstracts or titles of papers read at the April 1958 sessions of the Institute of Ethnography, including those on northern areas, viz.:

B. O. Dolgikh: research on the cultural and economic development of northern minorities conducted by the Ob, Taymyr, Evenki, lower Amur-Sakhalin, Anadyr, and Uelen teams of the Northern expedition.

M. M. Gerasimov: 1956–1957 excavations at Mal'ta (cf. No. 51149) and Ust' Belaya on Belaya River, a tributary of the Angara. The latter yielded two mesolithic horizons between a late paleolithic and a Serovo-stage neolithic culture.

M. G. Levin: field work on Chukotka comprised exploratory excavation of

Uelen burials (cf. No. 52795) and study of Chukchi-Eskimo blood groups (cf. No. 52787).

G. F. Debets: results of his studies of the Ipiutak and Tigara anthropological materials at the Museum of Natural History in New York. While Tigara's skeletons are identical with the present-day Eskimo types, Ipiutak men cannot be considered as Eskimo forebears, though both types may derive from a common ancestor.

Field work of the Institute's northern section was reflected in the reports on upper Kolyma Yukaghirs (S. I. Gurvich), present-day culture of the Ul'chi-Tungus (A. V. Smolîak), contemporary settlements and housing of Ostyaks (Z. P. Sokolova), trip to Eloguy Yeniseians (E. A. Alekseenko), expedition to Arkhangel'skaya Oblast' (V. M. Vishnevskaîa), hunting economy of the Podkamennaya Tunguska Yeniseians (D. M. Kogan). ***Copy seen:*** DLC.

51081. GARCIA, J. F., *and others.* Increase in red cell volume in response to long exposure to cold. (Society for Experimental Biology and Medicine. Proceedings, June 1957. v. 95, no. 2, p. 242–43, table.) 10 refs. *Other authors:* R. W. Belknap *and* S. F. Cook.

Rats exposed to $3° \pm 1°$ C. for 30 days showed an increase in total red cell; total circulating hemoglobin was also increased. ***Copy seen:***.DLC.

51082. GARDNER, GÉRARD. Quelques aspects de la mise en valeur du Grand-Nord, I; le développement des transports au Yukon. (Actualité économique, Jan.-Mar. 1957. année 32, no. 4, p. 581–603, maps.) 5 refs. Text in French. ***Title tr.:*** Some aspects of the development of the North, I; the expansion of transportation in the Yukon.

First of a series of papers (no. 2–3 *infra*, no. 4–5, not on arctic areas) on Canadian mineral resource development with emphasis on transportation, hydroelectric power, and government policy as factors in such development. Recent growth of highways and air service in the Yukon is considered: the existing road network; shorter and better routes proposed as alternates to the Alaska Highway, including one with branches to cities in Southeast Alaska; experiments in winter transportation over compacted snow and ice roads at Yellowknife; and the Alaska Freight Line's trucking experiment in winter 1954 from Fairbanks to the arctic coast. The role of aircraft is discussed, noting the Beverley, a plane specially adapted to northern conditions. A corporation established in 1951 has revitalized the White Pass and Yukon Railway, and controls a transportation network which includes road and river passenger and freight service. A customs-free outlet to the Pacific via a territorial corridor through Alaska is discussed.
Copy seen: DLC.

51083. GARDNER, GÉRARD. Quelques aspects de la mise en valeur du Grand-Nord, II; développement hydro-électrique et exploitation minière au Yukon (Actualité économique, Jan.–Mar. 1958. année 33, no. 4, p. 606–634, maps, table.) Text in French. ***Title tr.:*** Some aspects of the development of the North, II; hydroelectric development and mineral exploitation in the Yukon.

Discusses problems limiting the use of the region's water-power capacity. The aborted plans for metal-refining projects of Frobisher Ltd. and the Aluminum Co. of America (cf. No. 48860) are noted. Possibilities of building refineries on ocean inlets into Canadian territory, also of extending water-power rights to Alaska in exchange for a corridor from the Yukon to the Pacific are considered. Yukon mineral production, which would benefit from hydro-electric development is appraised by districts: the St. Elias, Cassiar, Pelly, Selwyn and Ogilvie Mts., Coast, Dawson and Klondike Chains, Pelly Plateau, Mayo and Northern Districts. Minerals, locations and dates of important discoveries, accessibility of deposits, companies working or prospecting in the area, prospects and probable value of future discoveries are noted for each district. ***Copy seen:*** DLC.

51084. GARDNER, GÉRARD. Quelques aspects de la mise en valeur du Grand-Nord, III; les ressources minérales des Territoires du Nord-Ouest et leurs problèmes. (Actualité économique, Apr.-June 1958. année 34, p. 89–105, map.) Ref. Text in French. ***Title tr.:*** Some aspects of the development of the North, 3; the mineral resources of the Northwest Territories and problems concerning them.

Appraises mineral development and discusses, in relation to it, transportation facilities, energy sources and government projects: a railway to Great Slave Lake with a branch to Pine Point; a road connecting mining centers of Great Slave and Great Bear Lakes, and one west to the

Yukon. Need for increased air service and for radio and television transmission is noted. Energy is available to the mines by purchase from the Northern Power Commission, or self-generated, using local water power, coal, or natural gas or oil from Norman Wells. Great Slave Lake, Great Bear Lake and Hudson Bay mineral regions are surveyed, and the more important developments described: gold and silver at Yellowknife, Rayrock's uranium, lead-zinc at Pine Point, uranium and radium at Port Radium, Belcher Islands' iron, and nickel-copper at Rankin Inlet. Exploitation of Baffin Island iron ores is considered.

Examines the social integration of population groups in this new town at the Iron Ore Co. of Canada's mining development at Knob Lake. The population, more than three-fifths French Canadian, was studied during summer 1957; individual adaptation, community values, sources of conflicts, etc. are outlined. The majority failed to adapt, leaving within a year. Factors responsible are analyzed: isolation, fatigue, long work hours, cold weather, lack of accustomed goods and services, the Company's economic and political control of the town, etc. Interethnic group tensions existing elsewhere in Quebec were transplanted to Schefferville. The most stable element is the French Canadians; their nationalism, the religious, family and ethnic group ties, also the Company's employee organization are cited as forces of social integration.

51089. GASSMAN, GEORGE J. Measurements of irregularities and drifts in the arctic ionosphere using airborne techniques. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 2, *pub.* 1957, p. 44–51.) 7 refs.

A summary is given of techniques and some of the results of measurements made in 1954–55 during about 70 flying hours in the area between Fairbanks, Thule, and the North Pole. Theoretical and observed ray paths are compared, and various interpretations are suggested for the observed phenomena. Some records are reproduced showing reflections from a scattering region above the F-layer. Airborne equipment is considered advantageous for investigating both the small- and large-scale structure of the ionosphere but the techniques are not completely developed.

KULLING.** Beskrivning till berggrundskarta över Västerbottens län: 1, urbergsområdet inom Västerbottens län; 2, den kaledoniska fjällkedjans berggrund inom Västerbottens län. Stockholm, 1955. 296 p. illus., maps (1 fold. in pocket), tables (2 fold.), diagrs. (Sweden. Geologiska undersökning. Ser. Ca, Avhandlingar och uppsatser, nr. 37.) Text in Swedish. Summary in English, p. 88–99, 287–96. ***Title tr.:*** Description to a map of the pre-Quaternary rocks of Västerbotten county: 1, the pre-Caledonian rocks . . .; 2, the Caledonian mountain range bedrock . . .

The pre-Quaternary rocks of Västerbotten are divided areally into three groups: the Precambrian rocks east of the Caledonian mountain range; the eastern marginal zone of the Västerbotten mountains; and the Västerbotten mountains proper. Northward these three groups extend into the Arctic. Description of the map is presented in two parts: the first (p. 1–99) by Sven Gavelin, covers the eastern Precambrian area; the second (p. 101–296) by Oscar Kulling, deals with the marginal and mountain areas. In the eastern area, earlier Svecofennian rocks are stratigraphically overlain by gneisses of the phyllite series and Jörn granites and the Revsund granite, which cover nearly eighty percent of the area. Unconformably over these lie the Vargfors series of sediments and volcanics and other rock of the Karelian system. The eastern marginal zone is composed of the lower Caledonian nappes and underlying autochthonous rocks. The Västerbotten mountains consist of the upper Caledonian overthrust sheets. Characteristics of the great variety of rocks are described and local interpretations are explained.

51119. GÉLINAS, LÉOPOLD. Preliminary report on Gabriel Lake area (west half) New Quebec. Quebec, 1958. 10 p. fold. map. (Quebec. Dept. of Mines. Geological Surveys Branch. Preliminary report, no. 373.) Ref.

Maps (1 in.:1 mi.) and outlines the geology of this 160 sq. mi. area (58°00′ −15′ N. 68°45′−69°00′ W.) about 18 mi. west of Fort Chimo. The consolidated rocks, all of Precambrian age, consist of pink and grey gneiss and a variety of schists, with layers of amphibolite, thinner in the gneisses than in the schists, parallel to the schistosity. Several pegmatite dykes cut the complex. All the schists are sedimentary rocks of the Labrador Trough, subjected to a higher grade of metamorphism than in the rest of the Trough. The quartzose and quartz-feldspar gneisses are assumed to be derived from sedimentary rocks of the Trough; the origin of the pink and grey gneisses is less certain. The structure of the area is folded, with a major anticline southwest of Green Lake. Deposits indicate that Pleistocene glaciers crossed the area in a direction approx. N. 10° W. Occurrences of massive limonite, mineralized shear zones and disseminated chalcopyrite, pyrite and pyrrhotite are noted. Lenses of iron formation are poorly exposed and have low magnetic content.

Copy seen: DGS.

51120. GÉLINAS, LÉOPOLD. Preliminary report on Thevenet Lake area (east half) New Quebec. Quebec, 1958. 7 p., fold map. (Quebec. Dept. of Mines. Geological Surveys Branch. Preliminary report, no. 363.) 3 refs.

Maps (1 in:1 mi.) and outlines the geology of this 160 sq. mi. area (58°00′–15′ N. 69°00′–15′ W.) approx. 30 mi. west of Fort Chimo. It is underlain by metamorphic rocks of Precambrian age, "granitic" gneiss, schists of sedimentary origin, amphibolites of igneous origin, and pegmatite dikes, resting in a series of northwestward-trending anticlines and synclines. All, including possibly the gneiss, belong or are related to rocks of the Labrador Trough. Contact between the gneiss and the other rocks, the eastern contact of the Labrador Trough, is discussed and various possibilities suggested to explain dissimilarities and divergences on either side. Glacial features and direction of the ice movement are noted. The iron formation is in thin layers, generally low in iron. Sulphides are present in small amounts. ***Copy seen:*** DGS.

51121. GEL'MAN, N. S., *and* G. D. ZENKEVICH. Biokhimiĭa rasteniĭ; bibliograficheskiĭ ukazatel' otechestvennoĭ literatury 1738–1952. Moskva, Izd-vo Akademii nauk SSSR, 1956. 394 p. Text in Russian. ***Title tr.:*** Plant biochemistry; bibliography of our country's literature 1738–1952. N. M. Sisakiĭan, chief editor.

Some 8500 references, mostly Russian but some foreign including English, are listed chronologically in four sections; the later two (1880–1916, 1917–1952) are grouped under chemical headings, and listed in chronological order. Scattered references deal with subarctic or arctic plants and trees, especially forest trees; effects of low temperature or climate on chemical processes, growth and development; frost resistance, etc. List of serials cited in abbreviation and an author index, are appended. ***Copy seen:*** DLC.

51122. GELTING, PAUL EMIL ELLIOT, 1905– . *Parmelia subaurifera* Nyl. and *P. fraudans* (Nyl.) Nyl. in Greenland. (Friesia, 1956. bd. 5, hefte 3–5, p. 240–46, illus.) 27 refs.

Contains descriptions and notes on habitat, ecology and geographic distribution of these two lichens, collected in Feb. 1950 near Godhavn, West Greenland. Both, very rare in Greenland, are recorded from northern Fennoscandia, Russian Lapland, and Novaya Zemlya.

Copy seen: DLC.

51123. GELTING, PAUL EMIL ELLIOT, 1905– . The *Rhizocarpon* species with peltate areoles occurring in Europe and North America. (Botanisk tidsskrift, 1954. bd. 51, p. 71–92, 6 illus.) 12 refs.

General appearance, structure of thallus and apothecia, and a key to the species are given. Four of these lichens are described: *Rhizocarpon arctogenum* n. sp.

and *R. bolanderi* (from Greenland), *R. leptolepis* (Lapland), and *R. rittokense* (Lapland, Baffin Island, Spitsbergen, and Novaya Zemlya), with data on variation, habitat, ecology and distribution.

Lists 103 economic districts (created in 1957), including, in the North: the Murmanskiy, Arkhangel'skiy, Komi, Tyumenskiy, Krasnoyarskiy, Yakutskiy, Magadanskiy and Kamchatskiy Districts; their boundaries are shown on the map. ***Copy seen:*** DLC.

51128. *GEOGRAFIÎA V SHKOLE.* Eshche odin podvodnyĭ khrebet v Arktike. (Geografiîa v shkole, Nov.-Dec. 1958. god 21, no. 6, p. 72.) Ref. Text in Russian. ***Title tr.:*** Another submarine ridge in the Arctic. Based on article in *Literaturnaîa zhizn',* July 4, 1958.

Notes a submarine range 560 km. long between the Lomonosov Range and the central arctic elevation ("tsentral'noe arkticheskoe podnîatie"); it is said to have been discovered by the drifting station North Pole-7. ***Copy seen:*** DLC.

51129. *GEOGRAFIÎA V SHKOLE.* Konferentsiîa po razvitiîu proizvoditel'nykh sil Vostochnoĭ Sibiri. (Geografiîa v shkole, Nov.–Dec. 1958. god 21, no. 6, p. 64–66.) 3 refs. Text in Russian. ***Title tr.:*** Conference on development of the productive resources of Eastern Siberia.

Brief account of the Conference called by Gosplan, Academy of Sciences and other organizations at Irkutsk in Aug. 1958, and attended by over 2,500. Plans were discussed for building a third metallurgical center on both sides of "Lake Baykal meridian". The abundance of coal in Eastern Siberia estimated at nearly 7 trillion tons, over three times that of the United States, and large resources of water power, iron and aluminum ores, timber, etc. present natural conditions for the metallurgical and chemical industries. But the railroad and river transportation require development. ***Copy seen:*** DLC.

51130. ***GEOGRAFIIÂ V SHKOLE.*** Korshunovskoe zheleznorudnoe mestorozhdenie. (Geografiiâ v shkole, July–Aug. 1957. god 20, no. 4, p. 68.) Text in Russian. ***Title tr.:*** Korshunovskoye iron ore deposit.

Among the many iron ore deposits in the Angara basin, the richest is Korshunovskoye, on the left bank of the Korshunikha River, a right tributary of the Ilim. Its ore resources are comparable to those of Magnitnaya and Blagodat' together, with 62% iron in the ore. Based on *Vostochno Sibirskaiâ pravda*, Feb. 26, 1957. ***Copy seen:*** DLC.

51131. ***GEOGRAFIIÂ V SHKOLE.*** Na dreĭfuûshchikh stanc̆iiâkh v Arktike. (Geografiiâ v shkole, July–Aug. 1957. god 20, no. 4, p. 68.) Text in Russian. ***Title tr.:*** On the drifting stations in the Arctic.

In 1957, the drifting station North Pole–4, set up in 1954, was evacuated; North Pole–6, set up in 1956 (on Apr. 19) was relieved by a new team under V. Driafs̆kiĭ; a new station, N̆orth Pole–7 headed by V. A. Vedernikov, was set up on an ice island at 82°04′ N. 164°50′ W. Information based on newspaper *Sovetskaiâ Rossiiâ*, Apr. 24, 1957.

Copy seen: DLC.

51132. ***GEOGRAFIIÂ V SHKOLE.*** Pamiâtnik Semenu Dezhnevu. (Geografiiâ v shkole, Jan.-Feb. 1957. god 20, no. 1, p. 62.) Text in Russian. ***Title tr.:*** Memorial to Semen Dezhnev.

Note on a beacon 16 m. high recently erected on Cape Dezhneva in memory of Dezhnev's deeds. Based on newspaper *Sovetskiĭ flot*, Oct. 13, 1956.

Copy seen: DLC.

51133. ***GEOGRAFIIÂ V SHKOLE.*** Sil'noe zemletriâsenie v Vostochnoĭ Sibiri. (Geografiiâ v shkole, Mar.–Apr. 1958. god 21, no. 2, p. 64–65.) Text in Russian. ***Title tr.:*** Great earthquake in East Siberia. Based on report of *Vostochno-Sibirskaiâ pravda*, Oct. 13, 1957.

Reports earthquake on Jan. 27, 1957, centered in the Muyskaya Ravin in northern Chita Province; violent shocks reached as far as the Nizhnyaya Tunguska basin. Study of the seismic waves disclosed a most complex propagation. Seismicity of the area is to be studied further by the East Siberian Branch of the Academy of Sciences, and a seismic station is to be set up at Bodaybo.

51134. ***GEOGRAFIIÂ V SHKOLE.*** Ukazami prezidiuma Verkhovnogo Soveta SSSR v techenie 1957–1958 gg. pereimenovany sleduûshchie goroda. (Geografiiâ v shkole, Nov.–Dec. 1958. god 21, no. 6, p. 68.) Text in Russian. ***Title tr.:*** List of towns renamed in 1957–58 by decrees of Presidium of the Supreme Soviet of the U.S.S.R.

Lists 15 towns named for Soviet leaders, which have reverted to their former or have been given new, nonpolitical names; Molotovsk in Arkhangel'sk Province is renamed Severodvinsk. ***Copy seen:*** DLC.

51135. ***GEOGRAFIIÂ V SHKOLE.*** V raĭone Verkhoâ̆nska. (Geografiiâ v shkole, Sept.-Oct. 1957. god 20, no. 5, p. 56.) Text in Russian. ***Title tr.:*** In the Verkhoyansk District. Based on article in *Sot̆sialisticheskaiâ Îakutiiâ*, June 15, 1957.

Outlines economic and cultural growth in the district chiefly due to development of tin ore deposits: new settlements outnumber Verkhoyansk itself in population, among them Batagay, the administrative center, Ege-Khay, Yanskiy, Deputatskiy, Ilin-Taas, Alys-Khaya, and Burgochan; several of them represent highly mechanized mining operations; a new port Nizhneyansk opened two years ago, steamers on the Yana, electric power stations, collective farms, hospitals, libraries, etc., are mentioned.

Copy seen: DLC.

51136. ***GEOGRAFIIÂ V SHKOLE.*** "Vtoroĭ Ural." (Geografiiâ v shkole, Sept.-Oct. 1958. god 21, no. 5, p. 79–80.) Ref. Text in Russian. ***Title tr.:*** "The Second Ural." Based on article in *Izvestiiâ*, May 25, 1958.

Notes discovery of valuable mineral deposits in the structural folding east of the Urals, including coal deposits in the Severnaya Sos'va River basin and natural gas at Berezovo. ***Copy seen:*** DLC.

51137. ***GEOGRAFISK TIDSSKRIFT.*** Nationalmuseets etnografiske samling 1956. (Geografisk tidsskrift 1957. bd. 56, p. 130–39, illus.) Text in Danish. ***Title tr.:*** The ethnographical collection in the National Museum 1956.

Includes information (p. 136) on work carried out by the National Museum, Copenhagen, in Greenland and North America: Jørgen Meldgaard's archeological reconnaissance in the Holsteinsborg District, West Greenland, his investiga-

tions in Labrador, Eskimo acquisitions, etc., are mentioned. ***Copy seen:*** DLC.

51138. ***GÉOGRAPHIA.*** Opération Groenland. (Géographia, Dec. 1957. no. 75, p. 13–20, illus.) Text in French.

Photo-reportage on the Aug. 27, 1956–Aug. 3, 1957, Expédition Française Centre Groenland, headed by Jean Dumont. The four-man team and equipment landed on the inland ice at 71°21′ N. 33°55′ W. by parachute from the French aircraft "Nord 2500". The construction and operation of the subterranean stations, scientific work, etc., and the return by foot to Rohss fjord are described. The aim of this expedition, an advance party for P.-É. Victor's expedition in 1959, was to demonstrate that a small team could be parachuted to an arctic region, survive, work and return unaided. ***Copy seen:*** DGS.

51139. ***GEOGRAPHICAL JOURNAL.*** Expeditions in the field during 1956. (Geographical journal, Mar. 1957. v. 123, pt. 1, p. 116–117.)

Notes: the North Sweden Research Group (University College, London) led by R. P. Kirby and D. B. Owen, working in geology, botany and geomorphology in the extreme north of Sweden between the districts of Katterjaure and Sjangeli; Durham University Expedition to Norway, led by W. A. Elders, with studies in glaciology, geomorphology and geology on N. Lyngen Peninsula; Anglo-Norwegian Frozen Ground Research Expedition, led by P. J. Williams, studying solifluction features in the mountains of central Norway. ***Copy seen:*** DGS.

51140. ***GEOGRAPHICAL JOURNAL.*** [Obituaries]. (Geographical journal, 1957. v. 123.)

Contains obituaries of: *Richard Evelyn Bird,* by R. B. Black, q. v.; *Leo Bagrov* 1881?–1957, authority on early cartography (pt. 4, p. 575–76); *Robert Neal Rudmose Brown* 1879–1957, British geographer and member of four expeditions to Svalbard 1909–1920, (pt. 4, p. 576–77); *Michael F. W. Holland* 1928?–1957, British geographer who died on the inland ice of Greenland during an IGY mission (pt. 4, p. 577–78); *Harald Ulrik Sverdrup* 1888–1957, oceanographer and meteorologist, member of the *Maud* 1918–1925, *Nautilus* 1931, and other expeditions, director of the Norsk Polarinstitutt (pt. 4, p. 578–79). ***Copy seen:*** DGS.

51141. ***GEOGRAPHICAL MAGAZINE.*** Airlines over the Arctic. (Geographical magazine, Mar. 1957. v. 29, no. 11, p. 523–29, 11 illus., text map.)

Reviews development since 1952 of commercial air service between Western Europe and western United States and Japan by Scandinavian Airlines System, Canadian Pacific Airlines (1955), and plans of Trans-World Airlines. Use of these shorter and safer, trans-arctic routes has been made possible by development of long-range aircraft, U.S.-Canadian military air bases in northern Canada and Greenland, arctic weather and radio stations. ***Copy seen:*** DLC.

51142. GEOLOGICAL ASSOCIATION OF CANADA. The glacial map of Canada. Toronto, 1958. 2 sheets, 31½ x 51 in. scale: 1:3,801,600, 1 in.=60 mi. Base map from Dept. of Mines and Technical Surveys, Lambert conformal conical projection, standard parallels at 49° and 77° N., modified polyconic projection north of 80° N.

Shows in color: existing glaciers, ice flow features, glacio-fluvial deposits, maximum extent of areas of marine submergence and of extinct Pleistocene lakes, former maximum extent of glaciation, approx. southern limit of permafrost and other glacial features. Inset map of rock outcrop and drift cover of the Canadian Shield, compiled by Jessie Falconer, scale: 1:9,504,000, 1 in.=150 mi. Sources, also individuals and organizations supplying information are listed, as are members of committee (J. T. Wilson, chairman) responsible for publication. Reviewed by C. W. M. Swithinbank in *Geographical journal,* Sept. 1958, v. 124, pt. 3, p. 386–89.

51143. GEORGE, J. J., *and others.* An empirical method of forecasting 24-hr. movement and change of intensity of sub-arctic North Atlantic cyclones. (*In:* Polar Atmosphere Symposium, Oslo, 1956. v. 1, *pub.* 1958, p. 156: abstract only "the full paper is likely to be published elsewhere.") *Other authors:* P. M. Wolff, *and* W. L. Somervell, Jr.

Technique requires only measurement of the 500-mb. height and temperature gradients above the current sea-level (cyclone) center, and determination of the type of 500-mb. flow in which the sea-level system is embedded. Results are empirical; large errors are more often encountered with storms originating over

North America than those over the North Atlantic or maritime western Europe. Movement and change of intensity are closely related; forecast of the latter gives best results in winter. Predictions of speed and direction of movement have also been tested only for the Oct.-Mar. period.—From authors' abstract. ***Copy seen:*** DLC.

51144. GEORGE, PIERRE, 1909– . Éléments pour une classification sommaire des régimes hydrologiques de l'U.R.S.S. (Annales de géographie, Mar.–Apr. 1957. année 66, no. 354, p. 167–72, tables.) 2 refs. Text in French. ***Title tr.:*** Elements for a summary classification of hydrologic regimes in the U.S.S.R.

Includes figures on the length, extent of basin, mean flow for the Ob, Yenisey, and Lena. Rivers of the U.S.S.R. are noted to have generally gentle gradients, great length, long frozen periods, short rapid rise in spring, etc.

51147. GERASIMOV, I. P. Strukturnye cherty rel'efa SSSR i ikh proiskhozhdenie. (Akademiîa nauk SSSR. Izvestiîa, ser. geograficheskaîa, Sept.-Oct. 1958, no. 5, p. 5–9.) Text in Russian. ***Title tr.:*** Structural features of the relief of the U.S.S.R. and their origin.

The geomorphic method is important for distinguishing and classifying various relief forms. Three groups of morphologic factors are considered: morphotexture, morphostructure and morphosculpture; and a regional division of the relief of the U.S.S.R. is proposed. The Soviet arctic regions are mainly formed by glacial action with the exception of Kamchatka where volcanic activity also played a part. This paper, introducing a new methodical approach for such investigation, represents part of a book in preparation. ***Copy seen:*** DLC.

Materialy i issledovaniîa po arkheologii SSSR, 1941. no. 2, p. 65–85, 294, illus.) Ref. Text in Russian. Summary in French. ***Title tr.:*** Manufacture of bone artifacts at the paleolithic site of Mal'ta.

Describes the artifacts made of reindeer antlers, mammoth tusks and animal bones (wedges, needles, knives, spear and dart points, tool handles, ornaments and sculptures) discovered between 1928 and 1937 at a stone age camp site at Mal'ta on the Belaya, a right tributary of the Angara River. The manufacture and engraving techniques of the bone artifacts,

use of stone production-tools, etc., are discussed and illustrated. The absence of polished bone articles and whetstones is noted. ***Copy seen:*** DLC.

51149. GERASIMOV, MIKHAIL MIKHAĬLOVICH, 1907– . Paleoliticheskaîa stoîanka Mal'ta; raskopki 1956–1957 gg. (Sovetskaîa ėtnografiîa, 1958, no. 3, p. 28–52, illus., diagrs.) 7 refs. Text in Russian. ***Title tr.:*** The paleolithic site of Mal'ta; excavations of 1956–1957.

Describes archeological excavations conducted at Mal'ta on the upper Angara River. Six pit houses with up to three hearths each, were unearthed: four quadrangular, permanent buildings, the largest 14 x 6 m., and two round, hut-like summer dwellings, the smaller 4.5 m. diameter. The walls of stone slabs and large animal bones supported a roof formed of antlers, the whole covered by animal hides. Though wood (birch and spruce) were available, hearth remains indicate reindeer bones as the main fuel. Most of the bones at the site were reindeer (*Rangifer tarandus*), though mammoth (*Elephus primigenius*), woolly rhinocerous (*Rhinoceros antiquitatis*), oxen (*Bos* sp.) and one bison (*Bison priscus*) were also found. The scarcity of Carnivora bones (18 foxes, four wolverines, wolf, lion) shows that fur hunting had not yet developed. The bone and stone artifacts consist mainly of crudely chipped chopping and scraping tools, cores, blades, awls and dart points, a variety of finely cut ornaments (pendants, bracelets, rings, pins, etc.), and sculptured female figurines and birds (swan, duck, partridge). The emplacement of the objects disclosed a significant pattern: men's attributes (hunting tools, bird sculptures) on the right side of the dwelling or near the right-hand hearth, women's belongings (knives, scrapers, needles, awls, ornaments, female statuettes) on the left. Though various local elements complicate an exact dating, the Mal'ta site is attributed to the Siberian variant of the Aurignacian. Author's 1956–1957 work for the Ethnographic Institute, carrying on that of 1932–1937 (cf. No. 51148), was done as participant in the Angara geologic-paleontologic expedition (Angarskaîa geologo-paleontologicheskaîa ėkspediîsiîa) of the Geologic Institute of the East Siberian Branch of the Academy of Sciences, U.S.S.R. ***Copy seen:*** DLC.

Presents results of 36 X-ray spectral analyses of ten zirconium minerals: mineral genesis, location of samples, zirconium and hafnium percentages and zirconium/hafnium ratio. The ratio ranges from 37 to 78, the maximum value typical of lovozerites (72–78), the minimum value of catapleite (46–48) and zirphesite (37–38). ***Copy seen:*** DLC.

51155. GERASIMOVSKIĬ, VASILIĬ IVANOVICH, *and others.* O ŝsirkonievogafnievom sootnoshenii v porodakh Lovozerskogo massiva. (Geokhimiĥ, 1958, no. 8, p. 743–48, table.) 11 refs. Text in Russian. Summary in English. *Other authors:* A. M. Tuzova, *and* I. D. Shevaleevskiĭ. ***Title tr.:*** On the zirconium/hafnium ratio in the rocks of the Lovozero massif.

Presents results of chemical and X-ray spectral analyses of three mineral complexes. The zirconium and hafnium content varies from 0.071 to 2.31% of ZrO_2 and from 0.015 to 0.057% of HfO_2 while the ZrO_2/HfO_2 ratio varies insignificantly. Agpaite rocks of the second and third complex have more zirconium and hafnium than miascite rocks of the first complex. ***Copy seen:*** DLC.

51156. GERASIMOVSKIĬ, VASILIĬ IVANOVICH, *and* **N. V. TURANSKAĨA.** Vysokoe soderzhanie lantana i ŝseriĥ v mineralakh agpaitovykh nefelinovykh sienitov Lovozerskogo massiva, Kol'skiĭ poluostrov. (Geokhimiĥ, 1957. no. 4, p. 334–36, table.) 10 refs. Text in Russian. Summary in English. ***Title tr.:*** High lanthan and cerium content in minerals of agpaitic nepheline syenites of the Lovozero massif, Kola Peninsula.

Quantitative correlation of rare earth elements in the Lovozero massif minerals is presented in a table indicating minerals, their location, spectral and chemical analyses and analysts' names. These nepheline syenites "are enriched in rare earth elements of the cerium group, particularly lanthan and cerium. In the nordite composition the odd lanthan element predominates over the even cerium element forming an exception to Oddo-Harkin's rule." The work of K. F. Murata and others is cited in support.

51157. GERDEL, ROBERT WALLACE, 1901– , *and* **F. DROUET.** The cryoconite of the Thule area. Wilmette, Ill., Nov. 1958. iv. 12, 2 p. illus., map, table. (U.S. Army. Corps of Engineers. Snow, Ice and Permafrost Research Establishment. Research report 50.) 6 refs.

Reports results of study of holes which hamper travel on access routes to Greenland icecap in summer months, the material in them named cryoconite by Nordenskiöld in 1870 (cf. No. 12401). The holes on the Nuna and Thule ramps, as studied in July 1954 and July 1956, are described and the results of analyses of their mineral and organic content are discussed in relation to their formation. The closely spaced cylindrical holes range from a few cm. to more than 1 m. in diameter with a depth of 30–50 cm. The larger holes are found at low elevations in the wet-ice zone, and small holes (1–2 cm. diam.) occur near the firn line. Water fills the holes to within a few cm. of the ice surface, and a gelatinous, gritty material (cryoconite) covers the bottom. Oven drying of

the drip-free cryoconite yielded 93–96% water and a dry residue containing 13.2–20.1% organic matter (eight species of algae, four fungi, desmids, and a rotifer), with the mineral fraction consisting of fine sharp grains, apparently wind-transported over short distances. The holes may be at least partly the product of energy released from photosynthesis and metabolism of the algae (the largest fraction of the organic matter), since algae primarily utilize radiation in the blue region from 0.40–0.65 μ where ice has the greatest transmissivity. The organisms are identified, and the algae are described in detail. Also issued (May 1959, 17 p.) in U.S. Army, Corps of Engineers, *Greenland ice cap research program, studies conducted in 1955–56*, v. 3, pub. June 1959.

51158. GERDEL, ROBERT WALLACE, 1901– . White-out in Greenland: cause and possibilities for control by weather modification. (Eastern Snow Conference, 15th, 1958. Proceedings, pub. 1958. v. 5, p. 31–45, illus., diagr., map.) 6 refs.

"The characteristics of various types of whiteout (overcast, fog, and precipitation whiteout) and related meteorological conditions are described; the results of studies by SIPRE since 1954 in Greenland are summarized; and possible countermeasures are discussed. An analysis of the formation of whiteout on the Greenland icecap indicates that whiteout of the fog and overcast type may be dispersed by seeding with freezing nuclei. Seeding from ground installations rather than the air appears to be the best solution for improving visibility of landing strips on snow and ice. A map showing the relation between wind flow and whiteout in Greenland is included."—SIPRE ***Copy seen:*** DGS.

Text in Russian. *Other authors:* M. S. Segal' *and* A. I. Solov'ev. ***Title tr.:*** Winter experience in use of concrete pumps.

Construction of the Gorky hydroelectric plant during winters, 1955, 1956, at average daily temperature of −21° C. and minimum of −40° C. is described in detail. The concrete mixers, pumps and electric water-heaters were installed in an insulated and heated shed with air temperature about 12° C. Winter concrete is made of Portland cement and 38–43% fine sand of glacier or alluvial grade with addition of sulfite-alcoholic solution. The temperature of the concrete mass was held at about 25° C. (for good plasticity); higher temperature involves destruction of valve and connections, lower temperature creates difficulties in pumping. The pipe line from mixer to place of work is assembled of pipes of 204 mm. diameter and maximum length 250 m. The line is well insulated, electrically heated and covered by wooden boards. Before pumping of concrete, all the piping was preheated by steam from a locomotive or tug-boat and at specially remote places, by hot air. After continuous pumping, the pipes were washed with warm water and three or four wads passed through at short intervals from each other, the last wad thoroughly soaked in oil.

51168. GHIGLIONE, ANGELO F. Paving the permafrost. (Asphalt Institute quarterly, Oct. 1958. v. 10, no. 4, p. 4–7, illus.)

The characteristics of permafrost, its effects on roads and road-construction practices in Alaska are described. The most satisfactory location is that which disturbs the permafrost least: a raised fill above icing heights, swept relatively free of snow by winds, and situated on the south side of hills and mountain ranges. Minimum grades and curves are critically important for road maintenance and snow and ice removal. Drainage ditches should be deep and narrow to minimize icing. Asphalt pavements of either road-mix or hot plant mix have proved most satisfactory in permafrost areas since they suffer least damage from deformation, though extensive crack sealing, spot paving, and leveling are necessary to re-establish uniform grade. Standard design provides a 2-in. mat of asphalt plant mix laid over a 4-in. crushed-rock base primed with asphalt and placed over a 15-in. granular subbase. Stage-type construction is necessary, accomodated to the progress of natural or artificial thawing.—From SIPRE.

51169. GHIGLIONE, ANGELO F. Subarctic highway construction and maintenance. (*In:* Alaskan Science Conference . . . 1954. Proceedings *pub.* 1957. p. 16–21.)

Discusses geological and physical factors affecting design, construction, and maintenance of Alaskan roads. Permafrost, of major importance, underlies about 80% of the land, and is so complex and so interrelated with the environment that generalizations are not valid. Weather changes, vegetation, and surface icing, usually associated with permafrost, are also factors. Rules to follow in site selection for new roads: location, excavation, grades and curves, ditches, and pavements, are stated, together with comment on bridge sites. Costs and maintenance including snow removal are discussed. ***Copy seen:*** CaMAI.

51176. GIBSON, T. Viability of cartilage after freezing. (Royal Society of London. Proceedings, 1957. ser. B, v. 147, no. 929, p. 528–29, illus.) ref.

Human chondrocytes remained alive up to six weeks at 4° C.; freezing, however, invariably killed them. Pretreatment with glycerol and slow cooling did not substantially change survival: no cells survived cooling to −15° C. for 15 min. ***Copy seen:*** DNLM.

51177. GIBSON, WILLIAM M. Gulf of Alaska trough parallels Aleutian Trench. (Geological Society of America. Bulletin, May 1958. v. 69, no. 5, p. 611–14, chart.) 6 refs.

Describes a recently discovered trough which begins near the bottom of the continental slope south of Yakutat Bay and trends southwest for 400 mi. to curve into the Aleutian Trench southeast of Kodiak Island. It is 500–700 ft. deep and two to three mi. wide over most of its distance, and slopes down to the west about 16 ft./mi. The depression may be a tectonic element marking the southeast edge of the geosyncline of the Aleutian Trench which is marked on the north by an inferred parallel extension of the Chugach-St. Elias fault. The existence of similar troughs in the Gulf is indicated but awaits confirmation.

51178. GIDDINGS, JAMES LOUIS, 1909– . Forest Eskimos: an ethnographic sketch of Kobuk River people in the 1880's. Philadelphia, 1956. 55 p. illus. (Pennsylvania. University Museum. Bulletin, June 1956. v. 60, no. 2.)

Reports recollections of pre-contact times as recounted, during author's 1940, 1941, and 1947 excavations along the upper Kobuk, in northwest Alaska, by three men and a woman in their seventies. The narratives deal in turn with summer, autumn, winter and spring activities, covering daily life, division of men's and women's work, fishing along the Kobuk and Squirrel Rivers, caribou and bear hunting, travel, house building, puberty and marriage rites, childbirth and children, sickness and shamanism, funeral customs, folklore, etc. Illus. by modern photographs. ***Copy seen:*** DSI.

51179. GIDDINGS, JAMES LOUIS, 1909– . Round houses in the western Arctic. (American antiquity, Oct. 1957. v. 23, no. 2, pt. 1, p. 121–35, illus., sketch map, diagrs.) 32 refs.

Describes discovery of six oval house pits on Choris Peninsula, Aug. 1956, during an archeological and tree-ring survey of the Eschscholtz Bay region of northwest Alaska. The northernmost of three large pits, 42 x 24 ft., on the ninth (oldest) of former beaches was excavated. The floor level began at 15 to 24 in. depth and yielded traces of postmolds, wood fibers, roof or wall remnants. A reconstruction of the original buildings is attempted. The forms and techniques of house contents refer the site toward Norton culture of the northern Bering Sea. The bone and stone artifacts and 250 potsherds with the Norton linear-stamped ornamentation are discussed. The excavated house is tentatively dated as 3000–4000 years old. The oval-shaped houses, apparently without corners or entrance passages, show some similarity to round houses excavated on St. Lawrence Island and on the Eskimo-Chukchi coast of Asia.

illus. on plates. (Harvard University. American School of Prehistoric Research. Bulletin, no. 20.). Refs.

This comprehensive and profusely illustrated work includes, in the chapter on the culture of the hunters and fishers of northeast Europe (p. 177–220), a description of the neolithic stage in the White Sea area from Karelia to the Urals: naturalistic animal sculptures and sculpture-decorated tools in stone, bone and wood, schematic flint figurines, etc. The style and motifs of rock engravings at Lake Onega and near the mouth of Vyg River are discussed and dated approx. 1000 B.C. Petroglyphs representing naked male skiers holding poles, bows and arrows, or associated with reindeer are noted in White Sea sites. A condensed version of this chapter's arctic elements has appeared as *An ancient art of hunters and fishers* in Archeology, Winter 1955. v. 8, no. 5, p. 268–77.

51197. GINI, CORRADO. De norrøne grønlandsbygders undergang. (Naturen, 1957. årg. 81, nr. 7, p. 410–32.) Text in Norwegian. ***Title tr.:*** The Norse Greenland communities' destruction.

Vestribygd, Eystribygd, and Herjolfnes in West Greenland were settled about 990 A.D. by at least 2000 Norwegians. Vestribygd was abandoned in 1342, the others about 200 years later. Reasons for their disappearance are analyzed in this study of comparative demography by a member of the Italian committee on population problems. It is concluded that, while many other factors contributed to adverse conditions, Vestribygd's abandonment resulted from an abnormally large number of the women joining neighboring Eskimo groups. Eystribygd's destruction is believed due to conflicts with Eskimos and to deterioration of the climate and economy. Herjolfnes probably was abandoned by a small degenerate group a short time later. These conclusions are discussed by K. Faegri, q.v. ***Copy seen:*** DGS.

51199. GINZBURG, I. V. Geologicheskoe polozhenie i vnutrennîaîa tektonika shchelochnykh granitov na Kol'skom poluostrove. (*In:* Akademiîa nauk SSSR. Kol'skiĭ filial. Shchelochnye granity Kol'skogo poluostrova, 1958. p. 213–24, illus., fold. diagr., map.) Text in Russian. ***Title tr.:*** Geological position and inner tectonics of alkaline granites of the Kola Peninsula.

Outlines the mode of genesis and paragenesis of alkaline granite intrusions and discusses the role of regional tectonics in the occurrence and distribution of alkaline granites. The tectonic fracture and distortion zones and especially disjunctive dislocations are examined and are shown to have played decisive roles in development of alkaline granite intrusions. A stratigraphic cross-section of Precambrian formations is evaluated and compared with the vertical distribution and mode of the alkaline granites. Tectonized forms of intrusions are treated and compared with the tectonic transformation of country rocks. Behavior of alkaline granites in the tectonic processes is examined from different angles and the effects are outlined. ***Copy seen:*** DLC.

51200. GINZBURG, I. V. K voprosu o formirovanii rel'efa severno-vostochnoĭ chasti Kol'skogo poluostrova. (Problemy Severa, 1958, vyp. 2, p. 116–28, illus. table, cross-sections, text map.) 6 refs. Text in Russian. ***Title tr.:*** On the question of relief formation in the northeastern part of the Kola Peninsula.

Presents morphologic characteristics of the area between the central watershed and Barents Sea, from the Voron'ya River in the west to the Iokanga River in the east. The relief is determined by the distribution and morphology of the fundamental crystalline rocks, mostly granites and para- and orthogneisses; by the arrangement of the lake-and-river net; and by the various forms of glacial deposits. These main features are treated in detail. Disposal of the crystalline rocks depends on the regional tectonics, geologic structure and physical and mechanical properties of the rocks. Relief forms of fundamental rocks shape the development of hydrographic net and the migration and deposition of glaciers. Lakes and river courses follow tectonic fracturing and distortion lines. Types of glacial forms: moraines, outwash fans, eskers, kames, etc., are described.

51201. GINZBURG, I. V. K voprosu o petrokhimii shchelochnykh granitov. (*In:* Akademiîa nauk SSSR. Kol'skiĭ filial. Shchelochnye granity Kol'skogo poluostrova, 1958. p. 260–307, tables, diagrs., text map.) Text in Russian. ***Title tr.:*** The petrochemistry of the alkaline granites.

Presents a comprehensive account of the petrochemistry, geochemistry and metallogeny of alkaline granites of Kola Peninsula, based on author's field investigation in a small area (approx. 67°45′–67°57′ N. 36°20′–36°40′ E.) and on the investigations of others. The main petrochemical features of alkaline granites generally are reviewed; the aegirite-arfvedsonite and aegirite-augite-hastingsite granites are treated in detail. The component, secondary and accessory minerals are evaluated. Variations of minerals and their chemical composition in various stages of consolidated magma are discussed. Spectral analyses, optical constants and vector diagrams of both groups of granites are examined. Both groups are compared with similar granites in the other parts of the U.S.S.R. and foreign countries, with conclusion that the aegirite-arfvedsonite granites are the most alkaline of the granite family; and that the aegirite-augite-hastingsites may be considered as subalkaline granites.

Presents the first results on vascular plants from a floristic study of the White Mts. northeast of Fairbanks in 1953, with analysis of plant communities by the Scandinavian - Middle - European method. Some 1500 specimens of approx. 500 species were collected. The vascular flora: 169 species, subspecies and varieties, are listed (dicotyledons and phytogeographic discussion to be pub. as pt. 2). Locality, distribution, frequency, ecological conditions, substrate, habit, etc. are noted. Comparisons are made with European and Greenland forms. Six species are new to the flora of Alaska: *Carex franklinii, C. stenophylla* ssp. *eleocharis, C. filifolia, Eriophorum triste, Deschampsia brevifolia,* and *Poa porsildii.* Distribution of selected species is shown on maps; an alphabetic index of all species and an introductory account of the White Mts. region, its geology and climate are included.

51211. GJELSVIK, TORE. Pitchblende mineralization in the Precambrian plateau of Finnmarksvidda, northern Norway. (Geologiska föreningen, Stockholm. Förhandlingar, 1957. bd. 79, häfte 3, no. 490, p. 572–80, 4 illus., map, diagr.)

Pitchblende, hematite, and chlorite are formed in a large carbonate breccia consisting partly of greenstones and greenschists, partly of albite-rich rocks. One of the latter, a coarse-grained albite "syenite" contains the uranium mineralization, while hematite is common in the whole breccia. The genesis of the pitchblende mineralization is discussed in relation to the main petrogenic processes of the orogeny: the granitization, the carbonization, and the albite rock formation. The close spatial relationship of pitchblende and albite "syenite" indicates a close genetic relationship.—Author's abstract.

51212. GJESSING, GUTORM, 1906– . Mountain-Saames (Mountain-Lapps) fishing at the sea-coast in the 17th and 18th centuries. (Studia ethnographica upsaliensia, 1956. v. 11, Arctica, p. 198–202.) 10 refs.

Mountain- and sea-Lapps were distinctly differentiated, but their territories overlapped sometimes, and their activities interfered with each other's basic economy: coast-Lapps engaged in reindeer hunting, ptarmigan trapping, etc. in the mountains in winter; mountain-Lapps descended into the coastal area in summer ruining cattle pastures with their reindeer herds. The mountain-Lapps' movements are shown through contemporary documents and their sea-fishing traditions traced to medieval times. The possibility of the sea-Lappish culture of Helgeland deriving originally from Swedish mountain-Lapps is suggested.

Geodetic, topographic-cartographic, and technical work is reported, that of arctic interest is as follows: On the initial SAS polar flight, gravitational measurements were established between Oslo and Anchorage, Alaska. The European gravitational net was expanded in several localities, including Svalbard; at sea such measurements were made by submarine at 150-ft. depth, 4 nautical miles from land, from Bergen to Bodø. Waterlevel elevations at coastal stations are tabulated. Precise elevations, first order and detail triangulations, also changes in level are reported. Cartographic work continued on the 1:250,000 and 1:50,000 map series; special, large-scale maps include Tromsø, Harstad, and Svolvaer harbors. Control points were established for aerial mapping and some air photography was carried out. The Tromsø sheet in the 1:1 million map series, Markhambreen at 1:100,000 and others produced or under way are cited. Twenty outline maps indicate status of the various mapping activities.

51223. GLEDITSCH, KRISTIAN, 1901– . Perspektivene for vår landsoppmåling. Hvordan vil de bli endret av Natosamarbeidet? (Teknisk ukeblad, Jan. 5, 1956. årg. 103, nr. 1, p. 4–14, text maps.) Text in Norwegian. ***Title tr.:*** Perspectives for our national survey. How will they be changed by the cooperation with NATO?

Discusses conflicting factors in mapping of Norway for civil and military purposes. Work on a general topographic atlas (scale 1:100,000) initiated in 1870, may be abandoned for one in scale 1:50,000. Precision levelling of southern Norway and basic levelling from Narvik to Vardø and Hammerfest, Karasjok and Kautokeino are completed; the first order triangulation of North Norway is out-dated. Military specifications calling for a different grid system, English- and American-produced maps introduced for military use, etc., are also factors in the situation. The present cooperation with the American Map Service should be continued for a while, but the Norges Geografiske Opmåling should be expanded to take full charge of all future surveying.

51225. GLEN, JOHN WALLINGTON, 1927– , *and others.* On the mechanism by which stones in till become oriented. (American journal of science, Mar. 1957. v. 255, no. 3, p. 194–205, diagrs.) 13 refs. *Other authors:* J. J. Donner *and* R. G. West.

In most till deposits, long axes of the stones tend to parallel direction of ice flow, but sometimes a transverse orientation also is noted. Experimental and theoretical studies show that elongated objects in a flowing liquid develop long axes parallel with flow direction in a short time, and over a long period a transverse orientation also develops. Theoretical results are compared with distribution of long axes found in various tills, including those in process of formation at Brageneset, Nordaustlandet (79°40′ N. 18°40′ E.) where large transverse orientations appear only in narrow band tills.

51239. GODSON, WARREN L., *and* **M. A. MacFARLANE.** Pressure-contour variance and kinetic energy over the Arctic. Montreal, Mar. 1958. 49, 20 p. map. diagrs., tables. (McGill University. Arctic Meteorology Research Group. Publication in meteorology no. 7.) 7, 9 refs. Contract no. AF 19 (604)–1141, scientific report no. 5.

In "some statistical aspects of numerical representation problems" (p. 1–21), Godson discusses relations between the standard deviation of contour height and the vector standard deviation of geostrophic wind velocity, both for variations in time and for variations in space. The relation between wind and contour variances for a simple schematic contour pattern is examined to shed light on the existing data for such parameters. In "Contour variance and kinetic energy" (p. 22–49), MacFarlane submits Godson's theory to an empirical test, based on the 500 mb. daily forecast charts (1955) drawn by the Dept. of Transport Arctic Forecast Team at Edmonton, and sampling the area from the North Pole to approx. 60° N. As expected, a high correlation was found to exist between the two parameters of Godson's study, for variations in time and in space. In both cases the standard error of estimate was too large to calculate the wind variance from the height variance, but climatological estimates may be made of the mean kinetic energy and of the size of the dominant pressure systems. Data tables are appended.

Geodetic, topographic-cartographic, and technical work is reported, that of arctic interest is as follows: On the initial SAS polar flight, gravitational measurements were established between Oslo and Anchorage, Alaska. The European gravitational net was expanded in several localities, including Svalbard; at sea such measurements were made by submarine at 150-ft. depth, 4 nautical miles from land, from Bergen to Bodø. Waterlevel elevations at coastal stations are tabulated. Precise elevations, first order and detail triangulations, also changes in level are reported. Cartographic work continued on the 1:250,000 and 1:50,000 map series; special, large-scale maps include Tromsø, Harstad, and Svolvaer harbors. Control points were established for aerial mapping and some air photography was carried out. The Tromsø sheet in the 1:1 million map series, Markhambreen at 1:100,000 and others produced or under way are cited. Twenty outline maps indicate status of the various mapping activities.

51223. GLEDITSCH, KRISTIAN, 1901– . Perspektivene for vår landsoppmåling. Hvordan vil de bli endret av Natosamarbeidet? (Teknisk ukeblad, Jan. 5, 1956. årg. 103, nr. 1, p. 4–14, text maps.) Text in Norwegian. ***Title tr.:*** Perspectives for our national survey. How will they be changed by the cooperation with NATO?

Discusses conflicting factors in mapping of Norway for civil and military purposes. Work on a general topographic atlas (scale 1:100,000) initiated in 1870, may be abandoned for one in scale 1:50,000. Precision levelling of southern Norway and basic levelling from Narvik to Vardø and Hammerfest, Karasjok and Kautokeino are completed; the first order triangulation of North Norway is out-dated. Military specifications calling for a different grid system, English- and American-produced maps introduced for military use, etc., are also factors in the situation. The present cooperation with the American Map Service should be continued for a while, but the Norges Geografiske Opmåling should be expanded to take full charge of all future surveying.

In most till deposits, long axes of the stones tend to parallel direction of ice flow, but sometimes a transverse orientation also is noted. Experimental and theoretical studies show that elongated objects in a flowing liquid develop long axes parallel with flow direction in a short time, and over a long period a transverse orientation also develops. Theoretical results are compared with distribution of long axes found in various tills, including those in process of formation at Brageneset, Nordaustlandet (79°40′ N. 18°40′ E.) where large transverse orientations appear only in narrow band tills.

51242. GÖTZLINGER, JULIUS. Motordrivna snöslungor. (Teknisk tidskrift, Apr. 1944. årg. 74, häfte 15, p. 427–31, illus.) Ref. in text. Text in Swedish. ***Title tr.:*** Motor-driven snow removal equipment.

Reviews development of such equipment; the American "Snow King Rotary Plow" and the Swiss "Peterfräse" are mentioned. Swedish AJ–42, AJ–43, and AJ–44 are briefly described. AJ–42 is tractor-driven and throws the snow 45 m. to either side; AJ–42, driven by a truck, has a throwing distance of 40–45 m. and is capable of removing hard-packed snow more than 1 m. thick. Truck-driven AJ–44 removes 25 cm. at a speed of not less than 20 km./hr., and has a throwing distance of 9–10 m.

51243. GÖTZLINGER, JULIUS. Slagseghetsdata och spröbrott. (Teknisk tidskrift, Apr. 10, 1956. årg. 86, häfte 15, p. 335–39, diagrs.) 11 refs. Text in Swedish. ***Title tr.:*** Impact-bending data and brittle fractures.

Discusses the transition temperature of iron and steel and criticizes the use of the Charpy-V test for determining brittle-facture temperature of large steel constructions. Other factors than composition and aging of the steel, such as shape of the structure, type of load, and the choice of welding electrodes and methods may be decisive factors. Major brittle fractures which have occurred in Sweden during the last 10–15 years should be published for use of construction engineers.

51246. GOGOLEV, Z. V. Iz istorii Aldanskogo promyshlennogo ra͡ iona, 1923–1934 gg. (In: Akademii͡a nauk SSSR. I͡Akutskiĭ filial. Doklady 1954, p. 44–61.) Approx. 40 refs. Text in Russian. ***Title tr.:*** From the history of the Aldan industrial district, 1923–1934. Paper delivered to the 5th session of Yakut Branch of Academy of Sciences, June 1952.

In 1922, M. P. Tarabukin, a Yakut, discovered gold on Nezametnyy Creek in the almost uninhabited taiga of Yakutia where the town of Aldan now stands. Further discoveries were made, and the Aldan gold fields became among the richest in the U.S.S.R. Mining development is outlined: organization of the trust "I͡Akutzoloto" (now: "Aldanzoloto") in 1923, new settlements, Aldan, Tommot, Seligdar, etc.; construction of the Never-Aldan highway; modern mining equipment; effects of the Aldan gold industry on economy of Yakutia.

Text in Russian. ***Title tr.:*** The use of models to study ground deformation under foundations during freezing.

"The problem is examined on the basis of laboratory experiments and field observations at Kiev and Sverdlovsk. Wooden 10 x 10 cm. blocks used as foundation models were placed on clay samples and subjected to frost action under various conditions. The moisture of the clay samples, the speed and rate of freezing, and the loading of the wood blocks were varied to determine their effects separately. It appears possible to construct foundations in seasonally frozen ground except for cases with intense ice formations, when the foundation must be set below the frost line. Foundation surveys should not neglect lateral heaving forces around foundations."—SIPRE.

51257. GOLOVNYKH, F. I. Razlichiîa v usloviîakh proizvodstva otdel'nykh grupp kolkhozov Megino-Kangalasskogo raĭona. (Akademiîa nauk SSSR. ÎAkutskiĭ filial, *Yakutsk.* Trudy, ser. ėkonomicheskaiâ, 1957. vyp 1, Materialy po ėkonomike sel'skogo khozîaĭstva ÎAkutii, p. 21–29, tables.) Text in Russian. ***Title tr.:*** Differences in production conditions of various collective farm groups of the Megino-Kangslasskiy District.

Outlines agricultural conditions in this district of central Yakutia. In 1955, it had 13.4% of the arable land, 31.7% of the hay-meadows, and 2.8% of the pastures of all Yakutia. Five factors are involved in the economic development and structure of the collective farms: natural conditions, location, facilities for processing agricultural products, a stable labor supply, and profits from the produce. The collectives are dealt with in three groups, according to land unit productivity, and for each group examples

and data are given in tables. Specialization is discussed and plans for better development are outlined.

(Razvedka i okhrana nedr, Apr. 1958. god 24, no. 4, p. 1–7, tables, map.) 8 refs. Text in Russian. ***Title tr.:*** Modern views on the Pechora coal basin and prospects for search and exploration of new deposits.

Outlines the coal reserves of the Pechora basin, mainly on the basis of recent investigations of a team of geologists of "Pechorauglegeologiîa" Trust. The coal basin, some 100,000 sq. km., about half north of the Arctic Circle, has its main areas along the right tributaries of the Usa, the middle and lower Pechora and along the Korotaikha and Kara. The lithology and stratigraphy of the basin is outlined; the depths, thickness and mineral impurities indicated, specimen coal seams are described. Much of the coal has a low ash content and is especially suitable for coking. Known and potential reserves are given. They are sufficient for years to come for all northeastern European Russia. Further exploration of the basin, the transport of coal to metallurgical industries of the northern and middle Ural, new railroad construction, and the development of a large power base are discussed.

Trudy, 1958. t. 14, p. 129–34, illus., diagrs.) Text in Russian. ***Title tr.:*** Experience in measuring absolute stresses in frozen rock.

A pneumatic method, which allows measurement of the radius-vectors of the cross section of a bore hole, is described. The apparatus consists essentially of a pressure regulator, a 3-tube rotameter from which a hose leads into the bore hole, and a pneumatic gage with 7 nozzles, which is inserted in the holes and measures linear values in the range from a few mm. to a fraction of a μ. The vectors of deformational distortions and stresses around the bore holes permit determination of stress characteristics at a given point, the direction of principal stresses, and absolute stresses in any given direction in the orthogonal plane. Tests conducted in a frozen coal stratum at −1° C. in Vorkuta gave stress values from 0.7–3.4 kg./sq. cm., depending on the distance of the point studied from the base of the stope, the

modulus of elasticity of the coal under compression being 3.2 x 10^3 kg./sq. cm.—From SIPRE. ***Copy seen:*** DLC.

A new Siberian Section (Sibirskoe otdelenie) of the Academy is to be set up (p. 65–66) with 13 scientific institutes, in the Novosibirsk area; it will coordinate the activities of the Academy's West Siberian, East Siberian, Far Eastern and Yakut Branches and the Sakhalin Complex Scientific Institute. ***Copy seen:*** DLC.

51274. GORBAT͡SKIĬ, G. V. Ėkspediт͡siâ na Novosibirskie ostrova. (Problemy Arktiki, 1958, vyp. 3, p. 127–29.) Text in Russian. ***Title tr.:*** Expedition to the New Siberian Islands.

Preliminary account, dated Oct. 31, 1956, of a 20-man Arctic Institute expedition headed by the author, to Stolbovoy, Bol'shoy Lyakhovskiy, Kotel'nyy and Bennet Islands in May-Oct. 1956. Division of party into five teams and their geologic, hydrologic, paleontologic, botanical and zoological explorations of each island, are noted, with stress on the ornithological observations on Stolbovoy, paleontologic and glaciological study of Bol'shoy (so-called) and the first systematic exploration of Bennet Island. Glaciological studies revealed that the fossil ice of Bol'shoy is basically of Quaternary origin. Further investigations in other parts of New Siberian archipelago are needed.

51275. GORBAT͡SKIĬ, G. V. Tak nazyvaemye ledniki Penka na Novoĭ Zemle i nekotorye cherty raĭona ikh rasprostraneniâ. (Vsesoûznoe geograficheskoe obshchestvo. Izvestiâ, Jan.–Feb. 1958. t. 90, vyp. 1, p. 55–58, map.) 2 refs. Text in Russian. ***Title tr.:*** The so-called Penck's glaciers on Novaya Zemlya and some features of their regional distribution.

The problem of glaciation in the Bezymyannaya River basin in the northwest part of the south island of Novaya Zemlya, where Penck's glaciers were discovered by P. L. Samoĭlovich in 1923, is discussed on the basis of author's investigations, in 1947. Signs of intense melting of the snowbeds and active development of rivers and lakes were observed as well as permafrost degradation. A large and relatively even snow-firn field was found in the region, but no signs of glacier activity: these "glaciers" seem to be in fact snowbeds, melting rapidly under the recent general warming trend in the Arctic. The extensive development of thermokarst in local limestones is a further indication of continuous fossil-ice melting.—From SIPRE. ***Copy seen:*** DLC.

51276. GORBUNOV, G. I. Mednonikelevye mestorozhdeniâ Ortoaĭvi v Pechengskom raĭone. (*In:* Akademiâ nauk SSSR. Kol'skiĭ filial. Voprosy geologii i mineralogii Kol'skogo poluostrova, 1958. p. 181–90, illus., map.) 3 refs. Text in Russian. ***Title tr.:*** Copper-nickel ores of Ortoayvi in the Pechenga region.

Outlines the morphology, structure and occurrence of small groups of sulphide copper-nickel ores, mainly in the western part of Ortoayvi mountain. Nine other copper-nickel beds in the Pechenga ore field are enumerated from west to east. The similarity in occurrence, structure and composition of the west Ortoayvi ores with two of the others (Kaula and Kamminkivi) is stressed.

These mountains, with Mt. Sablya (64°44′ N. 58°57′ E.) the highest peak, 1425 m., extend north-south 29 km. on the west side of the Urals, descending into the Pechora valley. The geomorphology, hydrography and flora of the area are outlined on the basis of previous investigations and on author's study in July 1954. Three floristic belts (mountain-taiga forest, sub-bald-peak, and bald-peak vegetation) are distinguished and described in detail, and their predominant plant associations are characterized. Spruce and fir prevail in the taiga of the lowest belt, high grass meadows dominate the middle belt, and the flora of the highest belt is chiefly lichens and moss. Traces of former glaciation are present in relict glaciers and cirque lakes; the upper forest line seems stabilized. Plant forms cited are included in the general index at end of volume. Those new for the area from the author's collection are listed (p. 123–25). The forest, meadows and fauna are of economic value.

51281. GORDAN, JOAN. A bibliography of the order Mysidacea. (American Museum of Natural History, New York. Bulletin, 1957. v. 112, art. 4, p. 279–304.) Approx. 1200 refs.

Lists publications on crustaceans of this order, to the end of 1955, in three parts. The first section records the literature alphabetically by authors; the second alphabetically under the species, and genera of the five families of Mysidacea. The third part is a listing according to (ten) subjects: general, taxonomy, morphology, etc., in which (85) papers of arctic interest may be found under fresh- and brackish-water, oceanic and coastal distribution. ***Copy seen:*** DSI–M.

51282. GORDIENKO, PAVEL AFANAS'EVICH. Arctic ice drift. (*In:* Arctic Sea Ice Conference. Proceedings, 1958. p. 210–21, 5 text maps, 6 graphs, 3 tables.) 60 refs.

Summarizes problem of ice drift; discusses Soviet studies of 1948–1956 on large- and small-scale ice movements. The wind-coefficient value of ice drift was found to depend on the compactness of the ice, the size of the ice floes, and the state of the ice surface (ice-jamming). Ellesmere Island ice drift in the region south of the New Siberian Islands is directed toward the Greenland Sea along the arc of a large circle. Farther away from the Greenland Sea toward Bering Strait, the role of surface currents in the general ice transport diminishes, and that of the wind increases. The wind component is less than 20% of the total drift value in the Strait between Spitsbergen and Greenland, and rises to 80% in the regions adjacent to Canada, Alaska, and eastern Asia. Only 20–30% of the wind energy is used for ice drift, the remaining 70–80% are spent in deforming the ice fields and local shifting. A circular ice drift exists in the vicinity of Canada and Alaska. Drift meander, loop-like evolutions, and rotary movements of the ice fields are also discussed.—From SIPRE.

(Problemy Severa, 1958. vyp. 1, p. 5–29, maps, tables, diagrs.) Ref. Text in Russian. ***Title tr.:*** Drift of ice in the central part of the Arctic Ocean.

Analyzes the drifts of North Pole–3, –4, and –5 in Apr.–Sept. of 1954 and 1955 with a view to establishing more definite rules for ice drift, and to illustrate the influence of variations in the general regime in the Arctic Basin on ice conditions in the shelf seas. Attempts to forecast the drifts of North Pole–3 and –4 according to "Zubov's rule" (No. 56257) were not entirely successful. In North Pole–4's 174–day drift in 1955, 50% of the time was occupied in describing loops (9), each completed in 4–18 days; the loops (three anticyclonic, six cyclonic) are diagrammed and wind, current, etc. data tabulated. The severe ice conditions on the Northern Sea Route in 1954 and 1955 are analyzed and explained on basis of the prevailing atmospheric pressure distribution in the Central Arctic, which, among others, created countercurrent winds delaying the seasonal drift of ice into the Greenland Sea. Changes in the currents of the Central Arctic and reciprocal action of drifting masses in coastal regions must be considered in the preparation of ice prognoses for any part of Arctic Ocean. ***Copy seen:*** DLC.

51288. GORDON, MALCOLM S. Supercooled fish from northern Labrador. (Polarboken 1958, p. 78–87, illus., maps.) 2 refs.

Results are recounted of investigations carried out by a summer 1954 expedition to Hebron Fjord (58°06′N. 63° W.), organized at the Woods Hole Oceanographic Institution. The survival of fish at temperatures of −1.7 to −1.8° C. was studied: the blood and other internal fluids of marine fishes generally begin to freeze at temperatures in the range of −0.7 to −0.9° C. Data obtained were inconclusive, but later experiments indicated that small amounts of supercooling (to about 2.5°) can be tolerated by fish provided there is no ice, hence the survival of the deepwater fish in Hebron Fjord. A March 1955 expedition established that the shallow water fish, which encounter considerable ice during the winter, change their blood concentrations seasonally and avoid freezing by increasing the concentration in their blood of some kind of antifreeze substance. ***Copy seen:*** SPRI.

51290. GORHAM, EVILLE. The salt content of some ice samples from Nordaustlandet (North East Land), Svalbard. (Journal of glaciology, Mar. 1958. v. 3, no. 23, p. 181–86, tables, diagr.) 8 refs.

Contribution to study of chemical composition of precipitation based on samples (remote from areas of industrial pollution) collected by E. Plumpton with the Oxford University Exploration Club Expedition to Nordaustlandet Aug. 1955, from the "West Ice" near Brageneset and north of Wohlenbergfjorden. The samples were taken from a fresh snowfall, from firn 6 km. inland and 350 m. above sea level, from surface ice at the edge of a moraine, from a crevasse, and a series at 1 m. intervals to 14 m. depth from another crevasse 1 km. from sea ice and moraines. "The results of analyses for pH, Na, K, Ca, Mg, HCO_3, SO_4, and No_3 . . . are reported. The individual ion composition did not show a clear correlation with depth, except for slightly higher nitrate levels in the upper samples with more morainic contamination. Na was predominant among the metal cations with values up to 7.5 p.p.m., while K was least, not exceeding 0.6 p. p. m. The maximum concentration of Ca and Mg were 1.3 and 1.0 p.p.m., respectively. Among anions, Cl reached the highest level with a maximum of 12.6 p.p.m., while bicarbonate generally did not exceed 3.2 p.p.m., except 7.8 p.p.m. near the moraine. SO_4 was the least abundant of all major anions. The concentration of NO_3 was 0.5 p.p.m. down to a depth of 7 m. and 0.010 p.p.m. at lower levels. Most of the samples were less acid than distilled water in equilibrium with atmospheric CO_2, pH ranging from 5.4–6.7."—SIPRE. Supply of atmospheric salts, like the precipitation is low on Nordaustlandet. Contribution of sea spray, soil dust, and Vestspitsbergen coal mines (sulphur) to the salts in the ice samples is discussed.

Describes in detail eruptions of Kryzhanovskiy and Vernadskiy Craters, in the vicinity of the lateral crater Yubileynyy. Preceded by a weak seismic tremor, the eruption had begun between July 27th and 29th when the author arrived at the piedmont of Klyuchevskiy. He made close observations (July 30–Aug. 1) of several lateral eruptions and the flow of lava streams; his photographs are included. ***Copy seen:*** DLC.

51302. GORSHKOV, G. S. Izverzhenie sopki Bezymîannoĭ; predvaritel'noe soobshchenie. (Akademiîa nauk SSSR. Vulkanologicheskaîa stantsiîa. Bîulleten', 1957. no. 26, p. 19–72, illus. diagrs., tables, map.) 9 refs. Text in Russian. ***Title tr.:*** Eruption of Bezymyannyy Volcano; a preliminary report.

A seismic shock recorded Sept. 29, 1955 by the station at Klyuchi, was followed by local weak earthquakes increasing in number and force Oct. 2–18, with epicenter in the region of Bezymyannyy Volcano (55°58′ N. 160° 35′ E.) of the Klyuchevskaya group. Bezymyannyy, considered extinct, began to eject vapour and ash from its eastern slope on Oct. 22; the volcanic cloud of increasing density extended to Ust'-Kamchatsk by Oct. 26, covering the ground with a thin layer of ash. After several relatively quiet days, eruptions resumed Nov. 7–20, and continued intermittently for several months with some fumarolic activities till, Mar. 30, 1956, a tremendous explosion occurred: the ejectamenta covered a 50 by 400 km. area, and the hot mud flow annihilated forests and flooded the Kamchatka River, contaminating its water for a week. Smaller eruptions

followed, May 17, June 4, and the volcano was still active at the end of June 1956, when this report closed. The author observed the eruption from the Volcanological Station at Klyuchi, 40 km. distant, and from various camps to 12 km. distance, with a flight, Jan. 26, to observe the crater, and dog-sled trips April 11–14, after the big explosion. All phases of the eruption are described and illus. by numerous photographs. The volcanic ash proved to be pulverized solid hypersthenic andesite; tabulated data are given on size of particles and chemical composition. The ash ejected from October till June is estimated at 0.4–0.5 km ^{3}; it lay 30 cm. deep at 15 km. distance and in Klyuchi 4.5 cm. deep or over 40 kg./m.^{2}. Seismic records for the time of explosion are discussed; the considerable increase of humidity in the air during ash fall-out is noted. The baric wave of the explosion attained a speed of approx. 0.8 of sound in the westerly and southwesterly direction, and to the east and northeast it equalled the speed of sound, causing standing waves in the mouth of Kamchatka River. The energy of the explosion is estimated at 5.10^{23} ergs, that of the released heat amounted to 2.10^{25} ergs. A geomorphic description of Bezymyannyy before the eruption (based on summer 1954 field work) is given in G. E. Bogoſavlenskaſa's paper: Vulkan Bezymſannyĭ i ego ėkstruzivnye obrazovaniſa (Bezymyannyy Volcano and its extrusive formations), in the same issue of this bulletin, p. 13–18, illus.

51303. GORSHKOV, G. S. Kamchatka Valley of Ten Thousand Smokes. (Pacific Science Congress, 9th. *Bangkok, Thailand,* 1957. Abstracts of papers, p. 121.)

"As a result of an eruption of Bezymiannaia sopka, a powerful agglomeratic stream 18 km. long was formed. It is similar to the Katmai stream. The mudflow passed a distance of 85 km. Thousands of secondary fumaroles rose from the surface of the agglomeratic stream; strong secondary explosions took place. The conditions under which the Bezymiannaia stream was formed were studied in sufficient detail to permit us to understand the conditions which prevailed when the Katmai stream was formed."

Formation and development of deposits suitable for insulation material are associated with specific type, structure and botanic composition of the peat. Moisture content is limited to 5–8%, degree of botanic decomposition less than 25% (heat conductivity and strength are controlled by the final manufacturing processes). The reserves of such peat deposits in the U.S.S.R. are estimated at about 65 million tons distributed through northern European and western Siberian regions including the Arkhangel'sk Province and Karelia, large areas between the Ob and Irtysh. Methods of surveying and sampling areas with peat deposits are described in detail. Data on microrelief, changes in botanic composition, degree of decomposition and boundaries of condensational peat are recorded for various depths, tabulated and illustrated by cross sections of stratigraphic profiles.

Outlines general recommendations made by a Swedish-Finnish-Norwegian committee on coordinated exploitation of rivers in the northern regions of these countries. The Muonio, Torne, and Kalix Rivers offer the best prospects for cooperative development. By transferring water from the Kalix to the Torne, a billion kw-h. could be developed by constructing 20 power plants along the latter. The committee suggested continuation of the negotiations. ***Copy seen:*** DLC

51322. GRAENSEFORENINGEN. Det nye Norden; om modsaetninger og samspil mellem Nordens folk, tilegnet brobyggeren Jørgen Bukdahl på 60 årsdagen den 8. december 1956. København, Danske forlag, 1956. 101 p., port. Text in Danish. ***Title tr.:*** The new Scandinavia; conflicts and cooperation between the peoples of Scandinavia, dedicated to Jørgen Bukdahl, the bridge builder, on his 60th birthday, December 8, 1956. Edited with a foreword by Bent A. Koch.

Twelve articles by various authors on national and minority relationships in northwestern Europe, dedicated to a Danish champion of minority problems. The papers are concerned with the thesis that the northern (Scandinavian) peoples have a common basis for growing cooperation. Karl Nickul's discussion of the Lapps (p. 49–54) sketches their economic conditions, and political and cultural history. The fostering of a Lappish nationalism at the present time is attributed in part to the exceptional recognition of the minority group by the northern governments. The federation of Lapps to support development of arctic Fennoscandia is noted as of international significance. ***Copy seen:*** DLC.

51323. GRAETER, PAUL. Die sauren devonischen Eruptivgesteine des Kap Franklingebiets am Kejser Franz Josephs Fjord in Zentral-Ostgrönland. København, C. A. Reitzel, 1957. 102 p. plates, illus. incl. 3 fold., maps, diagrs., tables. (Meddelelser om Grønland. bd. 155, nr. 3.) 68 refs. Text in German. Summary in English. ***Title tr.:*** The acid Devonian volcanic rocks of the Cape Franklin region of Kejser Franz Josephs Fjord in central East Greenland.

Describes Devonian eruptives, investigated during the Danish East Greenland Expedition led by L. Koch. Granites of the Cape Franklin region, known to be of Middle Devonian age, were mapped, chemically analyzed, and compared with granites of the northern Giesecke Bjaerge and the Central Metamorphic Complex. Comparisons showed no major difference. A Middle Devonian age has been assumed for all granites of the Giesecke Bjaerge, and, possibly, for post-orogenic granites of the Central Metamorphic complex. This may contribute to dating the events of the Caledonian orogeny in central East Greenland. Rhyolites, covering a much wider area than the granites, are regarded as the volcanic phase of the same magmatic activity. A late hydrothermal phase is represented by veins of fluorite, quartz, hematite, barite, strontianite and calcite. Supplements, petrographically, No. 39053. ***Copy seen:*** DGS.

51324. GRAF, W. The effect of histamine on skin and deep temperatures in man with particular reference to liver temperature. (Journal of clinical investigation, Aug. 1957. v. 36, no. 8, p. 1285–94, illus., table.) 42 refs.

Administration of histamine caused an identical fall in liver, hepatic vein, and gastric temperatures, with a less marked drop in rectal temperature. Concomitantly a rise in skin temperature took place, both effects being proportional to the dosage used. Other agents eliciting cutaneous vasodilatation acted similarly. It is concluded that the temperature lowering effect of histamine is due to increase of heat radiation from the skin. ***Copy seen:*** DNLM.

51325. GRAF, W., *and* K. GRAF. The rectum-liver temperature gradient in man. (Acta physiologica scandinavica, 1957. v. 41, fasc. 2–3, p. 138–48, illus.) 26 refs.

Account of continuous recordings, with thermocouples placed in the liver and rectal ampulla. In all ten cases examined rectal temperature was higher by a mean of $0.18 \pm 0.03°$ C. Pharmaca raising liver circulation increased the liver-rectum temperature gradient; a reversal of the gradient took place during initial phases of induced fever.

51326. GRAINGE, J. W. Water and sewer facilities in permafrost regions. (Municipal utilities magazine, Oct. 1958. v. 96, no. 10, p. 29, 62–67, map.)

The various sources of water in permafrost areas (wells, rivers, lakes, ice), and their exploitation are discussed; the construction of water and sewer systems is described; experience at Fort Smith, Inuvik, Hay River, Tuktoyaktut, etc. is cited. River water can be exploited by standard methods or with portable pumps where permafrost, unstable soil conditions, or the problem of ice erosion of river banks exists. Water can be drawn from deep lakes in winter by an intake pipe, or obtained from sea ice, or just under the sea ice near a river mouth, since the fresh river water floats on the heavier salt water. Freezing of buried pipes can be prevented by maintaining at all times sufficient water velocity in the pipes or by heating the water in dual-main systems. Dual-main (Yellowknife) and single-main (Fairbanks) water systems, also sewage-discharge methods used at DEW Line stations are described.—From SIPRE. ***Copy seen:*** DLC.

(*In:* Leningrad. Naucho-issledovatel'skiĭ institut geologii Arktiki. Trudy, t. 92, Nefte-gazonosnost' severa Sibiri, 1958. p. 171–82, diagrs.) 4 refs. Text in Russian. ***Title tr.:*** Geochemical investigation as one of the methods for prospecting genetical signs of matrix oil strata; according to samples from arctic regions of the U.S.S.R.

Presents results of geochemical study of mother substances of oil. Samples from Permian deposits at Nordvik, Olenek and Cape Tsvetkova (southeast Taymyr) and from Mesozoic deposits in the Ust'-Yenisey, Nordvik and Olenek districts were used, and the data are graphically depicted and discussed. In the Permian marine, lagoon and continental deposits, high content of potassium was indicated, and in Mesozoic deposits high sodium content. Other chemical differences between Permian and Mesozoic deposits are also noted and the reasons are discussed. Different sedimentation processes are treated. Assuming that the mother substances of oil are organic compounds and dependent on physical and chemical environments, the geochemical type of investigation is to be considered a supplementary method for oil prospecting.

Text in Russian. ***Title tr.:*** The stratigraphy and lithology of Permian deposits on the northeastern edge of the Siberian platform as related to their oil- and coal-bearing properties.

Monographic treatment of the stratigraphy and lithology of the Permian deposits in the Taymyr depression and adjacent regions, 70°–74° N. 100°–124° E. Distribution, main geographic and geologic features, and previous studies are reviewed. Stratigraphy of the cross-sections of Permian terrigenous and effusive-tuffaceous strata, mainly from the Anabar basin, is described and paleontological and palynological characteristics analyzed. The cross-sections are compared with those of Yuzhnyy Tigyan structure and other districts. Lithology of the Permian deposits of Anabar, Pura, Popigay, and Kotuy River basins is treated. Textural features, granulometric, mineralogic, and chemical characteristics are outlined and processes of diagenesis and epigenesis analyzed. Appraisal of mineral resource occurrence of studied area is disclaimed, but oil-bearing properties are indicated in the Pura basin and in western part of Yuzhnyy Tigyan uplift, and coal in the Kotuy River basin. Data supporting these indications are analyzed. ***Copy seen:*** DGS.

51337. GRAY, NORMAN G. Charting Canada's waterways. (Canadian shipping, Oct.-Nov. 1958. v. 30, no. 1–2, p. 46–50, 29–33, illus., map.)

Dominion Hydrographer describes activities of the Canadian Hydrographic Service, of interest to the shipping, mining, fishing industries. Map shows standard and provisional charting completed to 1958, including such (mainly provisional) in the North. Inland charting includes parts of the Mackenzie River system. Harbor surveys include ports to serve new mineral developments, Rankin Inlet, Ungava, Knob Lake, among others. Current operations and survey methods are outlined, stressing the significance of radar, echo-sounding equipment, and Decca. Vessels (7) of the Service are listed with note of tonnage, launch and helicopter equipment; three operate in the North; the newest, CGS *Baffin*, is described. Sailing directions issued are listed; one for arctic Canada (3 vols.) is in preparation.

51342. GRECHUKHIN, VLADIMIR VASIL'EVICH. Rezul'taty provedeniîa promyslovo-geofizicheskikh rabot v Pechorskom ugol'nom basseĭne. (Razvedka i okhrana nedr, May 1957. god 23, no. 5, p. 43–51, table, graphs.) Text in Russian. ***Title tr.:*** Results of geophysical prospecting in the Pechora coal basin.

Methods and coordination of the results of geophysical determination of coal deposits are described. Coal deposits in the Pechora region are of Permian age with complexes of sandy-siltstone-argillitic deposits and conglomerates. All coal layers have high electric resistance, on the basis of which, thickness and character of the coal can be estimated. The apparent electrical resistance method (KS method) is described with graphs. Other methods used (PS natural polarization, RT registered current, and VP induced potential) are noted. Results of all four are correlated (fig. 3) with definite agreement in a particular coal layer. In a very thick layer additional potential sounding is carried out for supplemental checking and correlation with data from core samples. Sharp decline of resistance in the coal layer is often caused by large ash content. Electrometric diagrams are correlated with the data of petrographic and other analyses (fig. 5). A satisfactory new technique in locating coal deposits and determining their extent is indicated. ***Copy seen:*** DLC.

51344. GREEN, L. H., *and* **K. C. McTAGGART.** Structural studies in the Mayo District, Yukon Territory. (Geological Society of America. Bulletin, Dec. 1958. v. 69, no. 12, pt. 2, p. 1752.) Abstract of a paper presented at the Ninth Alaskan Science Conference at College, Sept. 3–5, 1958.

Describes minor folds and other structures suggestive of intense deformation with the production of large-scale overturned isoclinal folds and low-angle faults observed in the Keno and Galena Hills, and a large-scale overturned fold in the Davidson Range. The overturned isoclinal folds formed during an early period of deformation, and in part of the district their axes were rotated in a later period of deformation characterized by open folding, faulting, and the develop-

ment of a wrinkle lineation. The silver-lead-zinc deposits occur in faults formed after these major deformations.

51345. GREEN, R. Polar wandering, a random walk problem. (Nature, *London*, Aug. 9, 1958. v. 182, no. 4632, p. 382–83, diagr.) 7 refs.

An attempt is made to fit paleomagnetic data to a random walk of the pole over the earth's surface, using the pole paths relative to Europe and North America. Angular displacement of the pole from its present position is plotted against the square root of time (in millions of years). It is emphasized that there are periods of very little effective displacement, e.g. the Quaternary; and periods of rapid displacement, e. g. the Carboniferous.

51346. GREENBANK, JOHN. Aggregational behavior in a freshwater sculpin. (Copeia, July 15, 1957. no. 2, p. 157.)

Some 100–125 sculpins, *Cottus aleuticus* Gilbert, adults and sub-adults, were observed July 25, 1956 on a boulder on a narrow shoal of one to three ft. depth along the southeast shore of Karluk Lake on Kodiak Island, Alaska. The fish, two or three deep in spots, were motionless, and remained so till the boat was almost upon them. ***Copy seen:*** DSI

51347. GREENBERG, L., *and others.* An immunological study of the Canadian Eskimo. (Canadian Medical Association. Journal, Jan. 1958. v. 78, no. 1, p. 27–31, tables, map.) Ref. *Other authors:* J. D. Blake *and* M. F. Gorman.

Report on a summer 1955 and winter 1954/55 study of the Eskimos in the Eastern and Western Arctic, the former probably the most isolated and "most clearly defined racial group in North America." Those living near large settlements were found to be well immunized, but not so those in isolated areas. A low incidence of "O" and "H" agglutinins to all salmonella tests was found. Tests for tularemia suggest this disease to be endemic in some areas; syphilis was found not to be prevalent in the population studied. ***Copy seen:*** DNLM.

51348. GREENBERG, L., *and others.* An immunological study of the Canadian Indian. (Canadian Medical Association. Journal, Aug. 1957. v. 77, no. 3, p. 211–16, tables, map.) 4 refs. *Other authors:* J. D. Blake *and* M. F. Connell.

Report on an immunological survey of Indian bands in various (including northern) parts of the country aimed at "evaluating past procedures and determining which infectious diseases were of particular importance in different areas." Past active immunization has proven very effective especially as far as diphtheria is concerned. Typhus and paratyphus appear to be highly endemic, and in certain areas (Northern Manitoba, James Bay region), tularemia. ***Copy seen:*** DNLM.

51349. GREENBLATT, J. H. Polarization in the corrosion of ice breakers. (Corrosion, Dec. 1957. v. 13, no. 12, p. 51–54, illus., tables.) 4 refs.

Polarization characteristics of steel coupons subject to the usual laboratory treatments given ship plating, were measured, and cathodic depolarization found to be the major factor influencing the corrosion observed. Higher temperatures and oxygenation are the most favorable conditions for corrosion; at low temperatures in oxygenated water, considerable anodic polarization occurred, mitigating corrosion. The measured cathodic and anodic polarization in volts/milliampere for steel specimens of varied surface treatment and under varied laboratory conditions, are tabulated; results are applied to explain the observations on three dry-docked vessels which had been operating in ice. ***Copy seen:*** DLC.

51350. GREENE, EDWARD LEE, 1843–1915. Certain Polygonaceous genera. (Leaflets of botanical observation and criticism, Jan.–Aug. 1904. v. 1, p. 17–50.)

A critical revision recognizing as genera the groups subgenerically known as *Bistorta, Persicaria,* and *Bilderdykia.* The first is known from Alaska: *Bistorta littoralis* (shores of Yes Bay, Th. Howell, no. 1048) and *B. ophioglossa* (an inland species from Ranch Creek in the Yukon Valley, June 26, 1899, by M. W. Gorman.)

51358. GREGORY, ROBERT A. Soil temperature changes associated with clearcutting. (*In:* Alaskan Science Conference . . . 1954. Proceedings *pub.* 1957. p. 7–10.) 2 refs.

Describes two changes responsible for the creation of seedbed conditions favorable for germination and survival of commercial trees in Southeast Alaska: disruption of stable soil conditions; and increased insolation. Initiation of these beneficial changes is believed to result in part from soil temperature, of which studies were made in the 1952 field season at the Alaska Forest Research Center in an open two-acre area. A warming influence in connection with the

mall clearing is evident, and the effect of warming on decomposition and plant activity is suggested.

Copy seen: CaMAI.

51359. GREGORY, ROBERT A. Some silvicultural characteristics of western red cedar in Southeast Alaska. (Ecology, Oct. 1957. v. 38, no. 4, p. 646–49, illus., tables, map.) 4 refs.

Reports investigation of *Thuja plicata* in old-growth and young-growth stands. It was found not to reproduce appreciably in the well stocked old stands apparently due to lack of light. In this area the species is at its northern limits and probably very sensitive to environmental differences. It was most common in stands of site index 110 and less, usually having a fire history. ***Copy seen:*** DLC.

Vsesoûznyĭ nauchno-issledovatel'skiĭ institut ozernogo i rechnogo rybnogo khozîaĭstva. Izvestiĭa, t. 41.) 263 refs. Text in Russian. Summary in English. ***Title tr.:*** Food resources of the Yenisey River fishes and their utilization.

A comprehensive study of conditions in some 3500 km. of this river, from Kyzyl (51°42′ N. 94°27′ E.) to the estuary. A review of past hydrobiological studies and methods introduces seven chapters, dealing in turn with: (*1*) general features of the basin, climate, geology, soils, hydrology, flora; (*2*) the fauna,

described (p. 37–113) in taxonomic order, from protozoans to higher fishes, with notes on the ecology of each form; (*3*) general review of the fauna and its formation: taxonomic and ecological composition, zoogeography, Quaternary history of the basin, and formative stages of its fauna. (*4*) The zooplankton, its composition and distribution, quantitative aspects, and (*5*) the bottom plankton, its elements, quantity and productivity are treated. (*6*) The animal benthos and its biocenoses, biomass and its distribution, annual production of the benthos are presented. (*7*) Fishes are considered from the economic viewpoint: distribution of species; food and its utilization; fish production and possibilities of increasing it. Biological and fish productivity was found to be not high due to low temperatures, poor soil and often swift current. This is partly compensated by the high quality of fish, consisting largely of salmon and pike. ***Copy seen:*** DLC.

51365. GREZE, VLADIMIR NIKOLAEVICH. Osnovnye cherty gidrobiologii ozera Taĭmyr. (Vsesoûznoe gidrobiologicheskoe obshchestvo. Trudy, 1957. t. 8, p. 183–218, illus., tables.) 49 refs. Text in Russian. ***Title tr.:*** Basic features of the hydrobiology of Lake Taymyr.

Account of a year-round study (July 1943–July 1944) of this large lake (4650 km² in area, 74°30′ N. 102° E.) in central Taymyr Peninsula. The plankton is dealt with first and its special composition, horizontal and vertical distribution, seasonal fluctuations and biomass are analyzed. The benthos is similarly reported: its qualitative composition, geographic origin, ecological zones, effects of freezing, biomass, etc. Discussion follows of the particular characteristics of this lake as an arctic water body, the effects of climate on seasonal growth periods and on duration of life.

The world's diamond mining industries are reviewed; the mining is described and diamonds for industrial purposes and gems are characterized. Early mining in the Urals (1938) and Yakutia is briefly outlined, with indication of the general geological character of the areas. In the major mining district of Yakutia, diamond deposits of three types were found: basic, loose (scattered), and conglomerate. The basic deposit found in 1954 represents numerous oval pipes of kimberlite in areas of 12,000 to 228,000 sq. m. and 4–5 m. depth. Mining is difficult, due to permafrost conditions to a depth of 200 m. The largest diamond (32.5 carats) of clear, gem type was found in the "Mir" deposit, of 120,000 sq. m. area. Another deposit Udachnyy ranges over an area of 225,000 sq. m. The loose diamond deposits are classified as: valley, brook, inclined, river bed and terracic types. The conglomerate deposits were found in the Vilyuy, Markha, Muna, and other river basins. Characteristics of these deposits and quality of the diamonds are described in detail. ***Copy seen:*** DLC.

51368. GRICE, G. D., Jr., *and others.* An unexplained mortality of Canada geese. (Journal of wildlife management, July 1956. v. 20, no. 3, p. 330–31, table.) *Other authors:* E. I. Tyson *and* E. B. Chamberlain, Jr.

Report on mass mortality around Huggle Pond, 12 miles north of Tallahassee observed during Feb.–Apr. 1954. Except for an extensive bloom of *Peridinium volzi* observed in this, but not

in neighboring ponds, no clue to this pestilence was found. It is believed to be a case of "red tide" affecting occasionally marine life, and also caused by dinoflagellates. ***Copy seen:*** DI.

"The cultures decisively confirm the opinion reached from field observation that the liverworts, especially *Cephaloziella*, can grow on media lower in combined nitrogen than any ordinary plants . . . This capacity explains the extensive liverwort carpets on the ash flats of Katmai . . . The more conservative conclusion is that their growth in "nitrogen-free" media was accomplished by the utilization of nitrogenous impurities present in concentrations below the thresholds of the tests available." ***Copy seen:*** DLC.

51374. GRIGGS, ROBERT FISKE, 1881– . Growth of liverworts from Katmai on "nitrogen-free" sand. (American journal of botany, May 1937 v. 24, no. 5, p. 295–98, illus.) 10 refs.

Liverworts were grown in pure culture on "nitrogen-free" sand for three years. For half of that period cultures to which 4 ppm. NH_4NO_3 had been added grew no better than "nitrogen-free" cultures; but latterly the "nitrogen free" cultures became pale and unhealthy. At the end of three years, 4 ppm. NH_4NO_3 was added to them and they promptly revived. There was no evidence of nitrogen fixation. These liverworts apparently subsisted in the "nitrogen-free" cultures on nitrogenous impurities so small in amount as to lie below the threshold of the chemical tests available for detecting nitrates, nitrites, and ammonia.

(*In:* Materialy po laboratornym issledovaniîam merzlykh gruntov, sbornik 3, 1957. p. 177–94, tables, graphs.) 26 refs. Text in Russian. ***Title tr.:*** Depression of the freezing point of water in dispersed soils.

"The effects of capillarity on f.p. depression in clay soils were studied in the laboratory. The experimental procedure is described, and data obtained are tabulated and discussed. Freezing-point depression was chiefly associated with a double action of mineral particles, which oriented water molecules on their surface and bound them by ions in a diffuse layer. The effects of the surface tension of water in the ground capillaries and of the number of the capillaries on the f.p. were insignificant. The effects of ions in the diffuse layer appeared only at temperatures of −0.5° or −0.6° C. or higher. Disorientation of water molecules in samples by electrolyte admixtures increased the content of easily frozen loosely bound water."—SIPRE. ***Copy seen:*** DLC.

Describes remains of a log-reinforced dwelling discovered on Cape Fomy (70°55′ N. 178°45′ E.) by an Eskimo hunter and viewed by the author in 1937. The cabin, located on a mountain slope, 35–40 m. above sea-level, is similar in shape to the yurta-type huts of shore Chukchis and Eskimos, and contained a number of wooden artifacts typical for Chukchi coastal hunters: harpoon shaft, spear, shovel, etc., also a spear or harpoon point made of walrus tusk and a blue bead. The latter, a Russian trade item, precludes a dating prior to the middle 17th century. An, at least temporary, Eskimo or Chukchi occupancy of the island in the 17th or 18th centuries is suggested. A shipwreck origin of the finds is considered rather unlikely, though not impossible. No excavations were conducted at the site. ***Copy seen:*** DLC.

51389. GROMOV, VALERIAN INNOKENT'EVICH, 1896– . Nekotorye novye dannye o faune i geologii paleolita vostochnoĭ Evropy i Sibiri. (Gosudarstvennaîa akademiîa istorii material'noĭ kul'tury. 51397. GROTH, ERLING. Banken og byen; Sandefjords sparebank, 1857–1957. Sandefjord, 1957. 351 p. illus., plates. Text in Norwegian. ***Title tr.:*** The bank and the city; Sandefjord's savings bank, 1857–1957.

This centennial jubilee volume gives a financial history of the southern Norwegian seaport, base of the whaling industry. Local conditions are assessed throughout in terms of international monetary fluctuations. Before the bank was established, the seaport was already building, outfitting, and manning whaling ships, at first in northern, especially arctic, waters, and later on a worldwide basis. This industry gave Sandefjord exceptional status in Norway, e.g., in the period of unemployment, 1876–1885, when its manpower was generally occupied, and in the mid-1920's when bank records show a steady financial situation in the whaling town. Growth of the whaling industry and of Norway's commercial fleet are shown by changes in types of ships and modernization of whale catching, processing, and transport at sea, also of related industries at the seaport. ***Copy seen:*** DLC.

51398. GROTH, KJELL. Suppression of evaporation from snow-fields. (Tellus, May 1957. v. 9, no. 2, p. 159–63, illus., tables.) 3 refs.

Increasing use of available water resources raises interest in artificial control of the geophysical water balance to make more water available. A more effective water economy may be attained by suppressing evaporation. Experiments were carried on in Stora Lulevatten in spring 1955, and later in the writer's laboratory to suppress evaporation from ice and snow by monomolecular films of fatty alcohols with and without an admixture of pigment. A mixture of octadecanol and hexadecanol combined with red iron oxide suppressed evaporation under laboratory conditions, and in the field the pigment positively affected the spreading power of the mixture. Data are tabulated on test conditions, relative evaporation from snow variously treated, maximum efficiency of the test substances, and the penetration of the substances into snow.

51405. GRUN, PAUL. Cytogenetic studies of *Poa*, I; chromosome numbers and morphology of interspecific hybrids. (American journal of botany, Oct. 1954. v. 41, no. 8, p. 671–78, 18 illus., 2 tables.) 34 refs.

Contains a study of polyploid bluegrasses, in which interspecific hybrids occur at two levels, a "triploid" level that results from fertilization of unreduced (apomictic) eggs, and a "diploid" level resulting from the fertilization of reduced (sexual) eggs. The majority of the hybrids are diploid. The morphology of hybrid plants may be ascribed to: a combination of the species characters, influence of differences between the ecological races of the parent species, and effect of differences in chromosome number among the gametes producing the hybrids. This study is based partly on material from Swedish Lapland (*P. pratensis* ssp. *alpigena*).

51406. GRUN, PAUL. Cytogenetic studies of *Poa*, II; the pairing of chromosomes in species and interspecific hybrids. (American journal of botany, Jan. 1955. v. 42, no. 1, p. 11–18, 3 illus., 2 tables.) 19 refs.

Chromosome pairing in *Poa* "reveals a pattern of regularity that is apparently superimposed on one of irregularity." Reports of various scientists on pairing of chromosomes in *P. pratensis* (northern Scandinavia), *P. alpina* and *P. laxa* indicate that well over 90% of the cells contain univalents, but when this irregularity is expressed as univalent frequency per cell, the range is only from 0 to 7 in different plants of these species. Thus the degree of irregularity of each cell is slight. Two exceptions to this normality are the various subspecies of *P. arctica* and the hybrid *P. alpina* var. *vivipara* x *P. arctica*, studied by Nygren (No. 24762), native to northern Scandinavia. Pt. III of this study does not contain arctic material.

Abstract of a paper presented at the Ninth Alaskan Science Conference at College, Sept. 3–5, 1958. *Other authors:* W. P. Brosge *and* H. N. Reiser.

Describes area between the Sagavanirktok River (approx. 148° W.) and 141° W., and from approx. 68° N. to the arctic coast. The exposed sedimentary rocks range from Silurian through Quaternary, with the exception of Pennsylvanian. Igneous rocks make up a minor part of the area. Mineralized rocks have been reported, but major mineral possibilities are not yet known. The belt of sedimentary rocks favorable for petroleum accumulations extends along the foothills and coastal plain, which are probably underlain in part by possible reservoir beds of Devonian, Mississippian, Cretaceous, and Tertiary age. The Shaviovik and Marsh Creek anticlines are closed structures; other similar structures are believed to be present. ***Copy seen:*** DGS.

Reports operations of some 30 companies in the "nickel belt" extending across Ungava Peninsula from Cape Smith (60°44′ N. 78°30′ W.) to Wakeham Bay (61°35′ N. 71°50′ W.). Sulfide deposits discoveries had been made by Murray Watts, Toronto geologist, in the early 1930's. From a base established in early spring 1957 at Esker Lake near center of the belt, aerial mapping and electromagnetic surveys were carried on by Spartan Air Services over a 5,000 sq. mi. area. Reports were analyzed at Esker Lake, and information conveyed by radio and aircraft to mining company field men; 7,000 ft. were drilled by late Sept.; assays showed values of 2.77 to 4% copper, 3 to 7.62% nickel. Airlift of supplies, construction of base, with ice (later 3,500 ft. land) air strip, beacon, radio equipment, prefab. housing, etc. and round-the-clock aircraft operations are described.

51433. GURINA, N. N. Nekotorye novye dannye o zaselenii Severa evropeĭskoĭ chasti SSSR. (Sovetskaîa arkheologiîa, 1957, no. 2, p. 115–20, illus.) Ref. Text in Russian. ***Title tr.:*** Some new data on the settlement of the north European part of the U.S.S.R.

Deals with a collection of 235 flint artifacts, flakes and potsherds found at a new archeological site on the upper reaches of a tributary of the lower Pechora, approx. 30 km. north of Nar'yan-Mar (67°40′ N. 53°05′ E.) and deposited with the Leningrad department of the Institute of Material Culture in 1955. The stone artifacts (arrow and spear heads, burins, knives and lamellar blades) mostly of high-quality light-colored flint and some hundred sherds of large (to 60 cm. diam.) egg-shaped, comb-and-cord decorated pottery vessels are described. The holecomb pottery was brought from the south by neolithic tribes who penetrated into the Bol'shezemel'skaya Tundra region along tributaries of the Severnaya Dvina and Pechora and perhaps advanced eastward along the White and Barents seacoasts. This lower Pechora pottery is closest to that found in sites immediately preceding the White Sea culture, but the slightly advanced flint material points to a somewhat later stage. The new site is dated tentatively in the first centuries of the second millenium B.C., on the basis of M.E. Foss' time scale (No. 29078), though Foss, lacking these newest finds, dated the first settling of the Bol'shezemel'skaya Tundra region to the late second—early first millenium B.C.

51435. GURTNER, OTHMAR. Glacier ice; Alpine glaciers and Greenland research. (*In:* Mountain world, 1956/57.

v. 11, p. 27–44, text map, 2 plates, diagrs., cross-sections.)

Current views on the mechanics and regime of glaciers are summarized. The transition of snow to ice, ice properties, external factors involved in the movement of glaciers, and conditions determining the ice regime are described. Other topics considered include: the relation between glaciers and climatic fluctuations, causes for the asynchronous behavior of glaciers, the role of moraines as indicators of glacier flow, ice erosion, and a comparison of alpine glaciers with icecaps. The results of recent icecap investigations on the structure and stratification of glacier ice, including modifications with motion, are summarized; and the glaciological program of the IGY, to be carried out by the International Glaciological Expedition to Greenland is outlined.

Text in Russian. ***Title tr.:*** Living and cultural conditions in the reindeer-breeding collective farms in the Nizhne-Kolymsk District. Paper delivered to 5th session of Yakut Branch of Academy of Sciences in June 1952.

Sketches activities of the collective farms "Turvaurgin," "Olenevod" and "Sutanîa-Udiran" (later. : kolkhoz imeni Stalina) with their centers at Kolymskaya, Tuustakh-Sen and Andryushkino. Their organization, national composition (percentage of Chukchis, Tungus, Yukaghirs, Yakuts, and Russians), rise of income, based up to 90% on reindeer breeding and exceeding now one million rubles/farm annually, are discussed. Herdsmen and their dogs, pastures and seasonal migration of herds, the îaranga and its advantages as a nomad's dwelling in the treeless tundra; also other types of dwellings, furniture, implements and clothing, etc., are described. Workers' income ranges from 10 to 40 thousand rubles a year. Fisheries and hunting are auxiliary occupations. Educational activities and acculturation are mentioned.

51438. GURVICH, I. S., *and* **I. V. PUKHOV.** Ė. K. Pekarskiĭ; k stoletiîu so dnîa rozhdeniîa. (Sovetskaîa ėtnografiîa, 1958, no. 6, p. 54–60.) Approx. 50 refs. Text in Russian. ***Title tr.:*** Ė. K. Pekarskiĭ; the centenary of his birth.

Biographical sketch with tribute to and review of his work in the fields of ethnography, folklore and linguistics of the Evenki (Tungus), Yukaghirs, Chukchis, Koryaks, and especially the Yakuts. His publications are listed in footnotes.

Copy seen: DLC.

51439. GURVICH, I. S. Ėkspediţionnaîa rabota Instituta îazyka, literatury, istorii i iskusstva ĪAkutskogo filiala Akademii nauk SSSR. (Sovetskaîa ėtnografiîa, 1951, no. 1, p. 194.) Text in Russian. ***Title tr.:*** Expeditionary work of the Institute of language, literature, history and art of the Yakut Branch of the Academy of Sciences U.S.S.R.

Preliminary report on the summer 1950 studies of the present-day culture of Yakut kolkhoz peasants by the Institute's complex expedition to the Ust'-Aldan and Amga districts (60°–65° N. 125°–135° E.). Soviet - period tales, songs and music were recorded, national dances and games studied and some historical and linguistic research conducted. ***Copy seen:*** DLC.

51440. GURVICH, I. S. Ėtnograficheskaîa poezdka v Koriîakskiĭ naţional'nyĭ okrug. (Sovetskaîa ėtnografiîa, 1957. no. 6, p. 43–58, 13 illus., maps.) 5 refs. Text in Russian. ***Title tr.:*** Ethnographic trip to the Koryak National District.

A report on author's investigations, Oct. 1956–Mar. 1957, of the present-day economy, customs and culture of the indigenous population of this district, and adjacent Kamchatka and north to Cape Dezhnev. The trip, undertaken for the Institute of Ethnography's Sector of the Peoples of the Far North, involved travel by dog team (1040 km.), reindeer

(180 km.), boat (120 km.) and airplane. The distribution of the Koryaks, Lamuts (Tungus) and Kamchadals within the district and their main settlements are described and mapped. The kolkhozes and sovkhozes, their economies (fishing and sea-mammal hunting or reindeer herding), growth of fish processing and canning industries are dealt with. Housing (ſaranga, chum and prefabricated houses imported from Khabarovskiy Kray), home furnishings (scarcity of furniture and preference for ſaranga-type furnishings) are noted. Clothing (Koryak national costume favored by most natives), educational, cultural and health services, etc., are discussed. The problem of Koryak education is stressed. The absence of a common Koryak language (nine different dialects are spoken) makes Russian mandatory as the language of instruction in schools, though children, at enrollment, speak only their own dialect. Mixed marriages are infrequent, though intermarriage between Koryaks, Evens and Russians are more common than between the shore and reindeer-herding Koryaks. ***Copy seen:*** DLC.

51441. GURVICH, I. S. ÎÛkagiry chuvanskogo roda v seredine xviii v. (Akademiîa nauk SSSR. Institut ėtnografii. Trudy, 1957. nov. ser. t. 35, Sibirskiĭ ėtnograficheskiĭ sbornik, pt. 2, p. 246–62, tables.) 4 refs. Text in Russian. ***Title tr.:*** The Yukaghirs of the Chuvan clan in the middle 18th century.

Describes and cites in full a property damage claim to the Russian administration compiled in 1754 by the Chuvantsy after their defeat and virtual annihilation by a combined force of Chukchis and Koryaks. The register of 25 claimants and their effects sheds an interesting light on the property valuation of livestock, weapons, utensils, ornaments, clothing, tents, sleds, etc. Their designation as "Yukaghirs of the Chuvan clan" tends to support the theory that the Chuvantsy are a Yukaghir tribe and not a separate ethnic group. ***Copy seen:*** DLC.

Paper delivered to 6th session of the Yakut Branch of Academy of Sciences, Oct. 1953.

Outlines development of this tax, a kind of tribute levy upon the indigenous population from the establishment of Yakut Province (voevodstvo) in 1638. Collections in 1657–58 amounted to 8,264 sable and 2,677 red fox skins, or 2.5 sable and 0.5 fox per taxpayer. With depletion of stocks, growing poverty of the population and tax collectors' abuses, the quantity of valuable furs declined and squirrel or even cash was accepted. Individual payments were replaced by a collective payment from the administrative unit or clan. The fur tax, nevertheless, was rarely paid in full and the government had to waive arrears from time to time. Data are given on number of taxpayers and amount of tax, based chiefly on unpublished materials; changing economic conditions and internal relations of various groups of the population in Yakutia are discussed. ***Copy seen:*** DLC.

51443. GURVICH, I. S. Kosmogonicheskie predstavleniîa i perezhitki totemicheskogo kul'ta u naseleniîa Olenekskogo raîona. (Sovetskaîa ėtnografiîa, 1948, no. 3, p. 128–31.) Text in Russian. ***Title tr.:*** Cosmogonic conceptions and the survival of totemistic cults among the population of Olenek district.

An outline of the principal creation myths based on verbal accounts of reindeer hunting and herding Yakuts of the upper Olenek River region. The basic concept of dualism (good and evil spirits) in the creation of the world and the role of totem animals in the creation of men and animals are discussed. The survival of totemism in shaman practices is noted. ***Copy seen:*** DLC.

Magadan, Oblastnoe izd-vo, 1956. 99 p. illus., fold. map. 16 refs. Text in Russian. ***Title tr.:*** Chukchi National District; a brief historical and geographical outline.

The Chukchi National District, over 720,000 sq. km. in area, in the far northeast of the U.S.S.R., was founded on Dec. 10, 1930. Till 1951, it formed part of Kamchatskaya Oblast'; in 1951–53, it was included in Khabarovsk Province,

and since 1953 it has been a part of Magadan Province. Boundaries, geomorphology, hydrology, coasts, vegetation, fauna, mineral resources and population of the District are sketched. Progress of collectivization since 1928, activities of 46 collective farms, development of industry, the importance of reindeer breeding with herds of over 400,000 (p. 40–44), hunting and trapping of furbearers, fishing, and the beginnings of agriculture and stock-breeding are described. Each of the six administrative regions (raion) of the district (Anadyrskiy, Markovskiy, Vostochnyye Tundry, Chaunskiy, Iultinskiy including Vrangel Island, and Chukotskiy) is described in turn: occupations of the people, settlements, schools, collective and state farms (p. 55–86). The general economic development of the area and progress of acculturation of Chukchis and Eskimos are stressed in conclusion (p. 87–97). Discovery and exploration of the area are reviewed (p. 15–22). Fold. map, 125 km.: 1 in., shows the District boundaries, its regions and main settlements.

51452. GUSTAFSSON, KARL ÅKE, 1908– . Polyploidy, life form and vegetative reproduction. Hereditas, 1948. bd. 34, häfte 1–2, p. 1–22.) 19 refs.

Some fundamental aspects of natural polyploidy are discussed and a phylogenetical picture of the phanerogam species in their various aspects of transformation is sketched, on the basis chiefly of Scandinavian material. The conclusion is offered, that: arctic floras contain a high proportion of polyploids; this is not due to the direct effects of extreme temperatures on cell formation, but to changes in the life-form system, reacting to the climate by an increase in vegetative disposal, bulbilifery and agamospermy. These changes facilitate the establishment of apomixis and polyploidy. The sexual representatives are about as polyploid as average Scandinavian mountain species. ***Copy seen:*** DLC.

51453. GUSTAFSSON, KARL ÅKE, 1908– . The relationship of *Calamagrostis neglecta* and *lapponica* in Siberia, as interpreted by Nilsson-Ehle. (Hereditas, 1946. bd. 32, häfte 3–4, p. 550–51.) 2 refs.

Abstract of Ehle's manuscript "Den subarktiska Lenafloran," based on collections in the Lena basin made during the Swedish Expedition in search of Andrée, 1898–99. The form from "Tigija" resembles *C. neglecta* and occupies a middle position between *C. lapponica* and *neglecta*. All pollen grains lack contents, justifying a hybrid interpretation, except that in *C. lapponica* itself the pollen is useless. If these two forms are not hybrids but true middle forms, *C. lapponica* and *neglecta* should be treated as varieties of the same species." See also No. 53686. ***Copy seen:*** DLC.

51454. GUSTAFSSON, KARL ÅKE, 1908– . Studies on the mechanism of parthenogenesis. (Hereditas, 1935. bd. 21, häfte 1, p. 1–112, 167 illus., 12 tables.) 131 refs.

Contains results of examination of male and female meiosis of various *Taraxacum*, *Archieracium*, *Erigeron* and *Marsilia*. The zygoid parthenogenesis is thought to consist of three processes: the primary pairing is decreased or omitted; the zygoid chromosome numbers arise through restitution nuclei, pseudo-homotypic metaphases and so-called somatic divisions; the egg-cell develops without any fusion of nuclei and cells. The origin of restitution nuclei is correlated with the univalence of the chromosomes but not caused by it. A pseudo-homotypic metaphase arises, when the stretching of the spindle is omitted and the univalents gather in the equator to divide. The so-called somatic division is probably nothing but a degeneration phenomenon (an ageing of the cell) and is accompanied by certain cytological peculiarities. The study is based partly on some species of *Taraxacum* and *Archieracium* native to Lapland. ***Copy seen:*** DLC.

51455. GUSTAFSSON, KARL ÅKE, 1908– . Zytologische und experimentelle Studien in der Gattung *Taraxacum*. (Hereditas, 1932. bd. 16, häfte 1–2, p. 41–62, 55 illus.) 44 refs. Text in German. Summary in English. ***Title tr.:*** Cytological and experimental studies in the genus *Taraxacum*.

Contains results of castration experiments in a number of forms of the group *vulgaria, erythrosperma, obliqua, spectabilia* and *ceratophora*. The always positive results show that sexual biotypes must occur very infrequently if they exist at all. The group *vulgaria* is triploid and occasionally tetraploid, so is *erythrosperma*; *palustria* is tetraploid, *obliqua* is triploid, *spectabilia* is tetraploid and occasionally pentaploid, *ceratophora* is triploid and tetraploid, and *arctica* is probably hexaploid. In *Taraxacum*, the formation of new forms by means of gene- and blockmutations associated with primary crossings as the cause of polyploidy seems to be the most plausible explanation. The study is based partly on material from Pite Lappmark (groups *vulgaria* and *spectabilia*) and from Greenland (*T. arcticum*).

Presents evidence of a genetic relationship between the Algonkian and Gulf of Mexico languages. The necessity of reconstructing Indian proto-languages is stressed. ***Copy seen:*** DLC.

51469. HACHEY, HENRY BENEDICT, 1901– . Canadian oceanography 1954–1957. Ottawa, Queen's Printer, 1957. 19 p. National report for Canada prepared for the International Union of Geodesy and Geophysics, Association of Physical Oceanography, Eleventh General Assembly, Toronto, 1957.

Developments in Canadian oceanography since 1954 are outlined, noting problems created by the long coast line and environmental factors, research and surveys in the Atlantic, Arctic, Pacific, and progress on sea ice research; agencies engaged in oceanographic work are reported. Oceanographic papers (90) by Canadians published 1954–57, are listed.

Copy seen: DN–HO.

51470. HACHEY, HENRY BENEDICT, 1901– , ***and others.*** Oceanographic features of submarine topography. (Royal Society of Canada. Transactions, June 1956. ser. 3, v. 50, p. 67–81, 4 text maps, 6 diagrs.) 13 refs. ***Other authors:*** L. Lauzier ***and*** W. B. Bailey.

Configuration of the sea floor off the North Atlantic and arctic coasts of Canada is delineated and discussed. Submarine topography of the Canadian Arctic and neighboring seas is described, and illus. by a text map; general circulation and vertical distribution of temperature and salinity are also described, with cross sections and a map. Relation of submarine topography and sea floor geology to physical, chemical, and biological oceanography is outlined.

Contains discussion of the key characters used for the classification of the dung-fly family: male hypopygium, the shape of the forceps and cerci, and pregenital ventral lamellae. Keys to genera and species, are followed by descriptions of one genus and four new

species, new synonymy, a check-list and find records of 87 species, 18 new for this area. Observations are added on the ecology and behavior of some species. With a few exceptions all the species are native to Swedish, Finnish and Russian (Kola Peninsula) Lapland and the Kuusamo region. ***Copy seen:*** DLC.

51474. HACQUEBARD, PIET ALBERTUS, 1918– , *and* M. S. BARSS. A Carboniferous spore assemblage, in coal from the South Nahanni River area, Northwest Territories. Ottawa, Queen's Printer, 1957. 63 p. 6 plates, 2 text maps, table, diagrs. (Canada. Geological Survey. Bulletin 40.) 24 refs. Abstract previously listed as No. 40196.

Geological exploration by several oil companies confirmed the existence of coal, and field relations indicated the presence of Carboniferous beds in the South Nahanni River area (61°06′ N. 123°59′ W.). A sample from a 4-ft.-thick coal seam, collected by John Patton of the University of Alberta, was examined. Data on location and stratigraphy of sample area are given. Results of chemical and petrographic analysis are described; a detailed analysis of the spore assemblage, of value to both the coal and oil industries, is provided, with a comparative index, which shows the South Nahanni assemblage more similar to that reported from northern U.S.S.R. than from the United States. Systematic descriptions of genera and species are also given, nearly all illus. by photos or diagrams. The South Nahanni River coal is the first definite indication of terrestrial deposition during the Carboniferous period in Western Canada. It is suggested that a "northern" floral province may have extended from northwestern Canada to northern Russia through the arctic regions.

Tourist's impressions of northern Norway under post-war reconstruction: Bodø, Tromsø, Hammerfest, Honningsvåg, Alta; housing, industry (fishery), etc. ***Copy seen:*** DLC.

51480. HÄGGSTRÖM, BÖRJE. Bestämning av vattenhalten i några nordsvenska råhumustäcken. (Svenska skogsvårdsföreningen. Tidskrift, 1950. årg. 48, nr. 2, p. 215–27, illus., table, graphs.) 13 refs. Text in Swedish. Summary in German. ***Title tr.:*** Determination of water content in some raw-humus covers in northern Sweden.

Samples from the raw-humus layer were taken at two-day intervals, June 8–July 19, from 12 plots at Lycksele. Vegetation, forest and soil types, and thickness of the humus and bleached-earth layers for each plot are presented in tabular form. Moisture content is graphed with rainfall and temperature data of the period. The water content on all plots was found considerably below the optimum for the breakdown of humus; the available moisture in the moist *Calluna/Vaccinium* types was barely enough, and in the dry types was not enough, for germination of pine and spruce; there was a good correlation between thickness of the bleached-earth layer and moisture content of the raw humus.

51481. HAEKEL, JOSEF, 1907– . Bestattungsbräuche und Totenerrinnerungsmale bei den Indianern Nordwestamerikas. (Wiener völkerkundliche Mitteilungen, 1955. Jahrg. 3, no. 1, p. 22–30.) 25 refs. Text in German. Summary in English. ***Title tr.:*** Burial customs and memorial feasts of the northwest American Indians.

Includes a review and interpretation of the burial rites of the Tlingit, Haida, Tsimshian and Kwakiutl Indians. Special attention is given to dances with animal masks, burial potlatches, totem and memorial poles, and to the part played by chieftains and shamans. A connection is suggested bstween masked dances and myths of origin. ***Copy seen:*** DSI.

51482. HAEKEL, JOSEF, 1907– . Zum Problem der Konstanz und des Wandels in den Kulturen Norwestamerikas. (International Congress of Americanists, 31st, *São Paulo*, 1954. Proceedings, 1955, v. 1, p. 15–26.) 33 refs. Text in German. ***Title tr.:*** The problem of constancy and change in the cultures of northwest America.

Discusses the chronology of the settlement of the Pacific Coast and states a case for an originally inland culture center. Ecological, economic, linguistic aspects and factors of social organization of coastal tribes (including the Tlingit, Haida and Kwakiutl) are analyzed. The formation of the typical coastal culture is ascribed to Kwakiutl forebears around 900 B.C. The era of the first century B.C. to first century A.D. is suggested for the start of the southern (coast-Salish) and northern (Tlingit) cultures.

51483. HAEKEL, JOSEF, 1907– . Zur Frage alter Kulturbeziehungen zwischen Alaska, Kalifornien und dem Pueblo-Gebiet. (International Congress of Americanists, 32nd. *Copenhagen*, 1956. Proceedings, 1958. p. 88–96.) 34 refs. Text in German. ***Title tr.:*** On the problem of old culture relationships between Alaska, California and the Pueblo region.

Discusses the construction, manifold use, origin and diffusion of the Alaskan Eskimo men's house, *kashim*. A domed semi-subterranean structure used for male initiation and other secret rites, it served also as sweatbath, dormitory, work shop. Author speculates on its east-Asiatic origin, possible presence in the Old Bering Sea and Ipiutak cultures, and quasi-certain existence during the prehistoric stage of the Thule culture. Its use by the Greenlandic Eskimos around 1100 A.D. is noted; a dating of 400–200 B.C. is proposed for its appearance in Alaska and 300 A.D. for its southward advance. The possibility is seen of a parallel spread of certain Eskimo initia-

tion rites and mortuary beliefs to the California and Pueblo Indians.

(Finska vetenskaps-societeten. Commentationes biologicae, v. 9, no. 7.) 13 refs. Text in German. ***Title tr.:*** Microvegetation in the growths of *Buxbaumia aphylla* and *Siphula ceratites;* a contribution to the knowledge of aerial algae.

Includes data on 18 localities of the lichen *Siphula ceratites* in the Pechenga region of Russian Lapland, with lists of other cryptogams. This lichen associates usually with algae of the genus *Stigonema* which form the ground cover. The algae bind the soil particles, and are followed by *Siphula* and other cryptogams. These micro-associations thrive in the humid climate of Pechenga, northern Norway, and probably other arctic regions. ***Copy seen:*** DLC.

51485. HAFTORN, SVEIN. Grenseforskyvninger i den nordnorske fuglefauna og andre resultater fra en reise i 1955. (Norske videnskabers selskab, Trondheim. Museet. Årbok, 1956–57, p. 15–47, 2 illus., 10 text maps.) 56 refs. Text in Norwegian. Summary in English. ***Title tr.:*** Extensions of limit in the avifauna of North Norway; results from a journey in 1955.

Distribution of some thirty birds in Nordland, Troms and Finnmark is studied, and comparisons made with data collected 30–100 years ago. As expected, several species proved to have extended their ranges northward or to have increased in number within their previous ranges, especially *Emberiza citrinella, Fringilla coelebs, Carduelis spinus, Parus major, Muscicapa hypoleuca* and *Garrulus glandarius.*

Copy seen: DA.

51486. HAFTORN, SVEIN. Kjøttmeisas, *Parus m. major* L., innvandring og nåvaerende utbredelse i Nord-Norge. (Norske videnskabers selskab, Trondheim. Forhandlinger, 1957. bd. 30, no. 3, p. 14–21, 3 illus.) 29 refs. Text in Norwegian. Summary in English. ***Title tr.:*** Immigration and present distribution of the great tit, *Parus m. major* L., in North Norway.

Rare in Troms and Finnmark before 1940, this bird was relatively commonly distributed in suitable places in North Norway through 1955; it was found breeding up to 70°30′ N. and later at 71°05′ N. Its increase has probably taken place since 1930, and its occurrence is related to changes in the winter: mild winters probably favor the bird.

Copy seen: DLC.

51487. HAFTORN, SVEIN. Populasjonsendringer, spesielt geografiske forskyvninger, i den norske avifauna de siste 100 år. (Stavanger, Norway. Museet. Sterna, Sept. 1958. bd. 3, hefte 3, p. 105–137, 7 illus., 3 tables.) 68 refs. Text in Norwegian. Summary in English. ***Title tr.:*** Population changes, especially geographical changes, in the Norwegian avifauna during the last 100 years.

Contains data on regional changes in distribution, horizontal or vertical, and long-term numerical changes in stock. Some old breeding birds have extended northwards, e.g., *Emberiza citrinella, Passer domesticus, Fringilla coelebs,* etc. *Vanellus vanellus, Numenius arquata,* and *Ardea cinerea* have partly extended their coastal distribution above the Arctic Circle and all show a clear tendency to spread inland. Species with diminishing distribution in Norway are reviewed in table 3. ***Copy seen:*** DI.

51488. HAGBERG, NILS. Storskogsbrukets karteringsmetoder med begagnande av flygbilder. (Svenska skogsvårdsföreningen. Tidskrift, 1956. årg. 54, nr. 3, p. 223–64, illus., tables, maps.) 10 refs. Text in Swedish. ***Title tr.:*** Forestry mapping methods with use of aerial photographs.

Air photographs were used experimentally for forestry in Sweden about 1930. In the large forest and upland areas of the North, they have come into general use for map revision, field studies, and to some extent as map substitutes. Overlapping single camera vertical photographs at scale 1:20,000 are most useful. Various combinations of office and field annotations and of map and photographic supplements are discussed. Series of single prints and stereo pairs are preferred to mosaics. Scale and interpretation difficulties in irregular terrain require

refinement and solution. Lower costs and time saving are found with air photographs, and their use is increasing, though the older foresters often prefer maps.

Copy seen: DA.

51489. HAGEN, INGVAR. The common crossbill, *Loxia curvirostra* L., in North-East Greenland. (Nytt magasin for zoologi, 1956. v. 4, p. 107–108.) 8 refs. *Pub. also* as: Contrib. no. 63, Zoological Museum, University of Oslo.

Contains a study of the skin of a female-colored crossbill taken at Cape Herschel, 74°14′ N. 20° W. about July 1, 1953. The specimen is defective and exact determination was impossible: it is either *L. curvirostra pusilla* coming from northwest America, or a *L. c. curvirostra* coming from Europe or Siberia, the latter seems more probable. This is the fourth known record of crossbill in Greenland.

51490. HAGERUP, OLAF, 1889– . Autogamy in some drooping *Bicornes* flowers. (Botanisk tidsskrift, 1954. bd. 51, p. 103–116, 16 illus.) 10 refs.

Flowers and biology of 14 *Bicornes* plants, including *Vaccinium uliginosum* var. *microphyllum* forming enormous growth on the east coast of Greenland (71° N.) and *Cassiope tetragona* (Greenland 71° N.) are described. Only further investigations can establish whether drooping *Bicornes* are normally autogamous. ***Copy seen:*** DA.

51491. HAGERUP, OLAF, 1889– . Lidt om mallemukken: stormfuglen, *Fulmaris glacialis*. (Grønland, Feb. 1958, nr. 2, p. 50–57, illus.) Text in Danish. ***Title tr.:*** Notes on the fulmar (*Fulmarus glacialis*).

Contains general biological notes with emphasis on flying technique and feeding habits; author's study of the latter on 50 birds in Davis Strait (64° N.) in 1925 disclosed the most important item in the diet as plankton. ***Copy seen:*** DLC.

51492. HAGERUP, OLAF, 1889– . Notes on some boreal polyploids. (Hereditas, 1944. bd. 30, häfte 1–2, p. 152–60, 21 illus.) 12 refs.

Contains cyto-geographical and cyto-ecological data on 20 species of flowering plants. *Linnaea americana* (n=2x8) differs very little from the European *L. borealis* in external morphological features, but the two species differ ecologically. In Greenland, *L. americana* grows in some few places in a low scrub of arctic bushes (*Empetrum, Salix glauca* and *Vaccinium uliginosas*) and is found as far north as Disko (70° N.), where it thrives and flowers profusely. Altogether it is somewhat larger and more robust than *L. borealis*.

Copy seen: DLC.

51493. HAGERUP, OLAF, 1889– Studies on polyploid ecotypes in *Vaccinium uliginosum* L. (Hereditas, 1933. bd. 18, häfte 1–2, p. 122–28, 2 illus.) 10 refs.

Contains results of the study of two forms, *V. u.* f. *genuina* (n=24) from East Greenland (66°30′–71° N.) and *V. u.* f. *microphila* (n=12) from the same region. The polyploid forms with the greatest number of chromosomes are considered the most resistant in unfavorable climates. But it is not always so, as in the case of these bilberries, the arctic form is diploid. Polyploid forms may be ecologically changed to grow in other climates and formations where the diploid form will not thrive. Environment may play a considerable part in the formation of new species. ***Copy seen:*** DLC.

51494. HAGERUP, OLAF, 1889– . Studies on the significance of polyploidy, III; *Deschampsia* and *Aira*. (Hereditas, 1939. bd. 25, häfte 2, p. 185–92, 10 illus.) 10 refs.

Contains data on seven species of the grass *Deschampsia*, of which only one, *D. setacea* (Denmark), is diploid and has n=7. Five species, viz *D. flexuosa, caespitosa, arctica* (East Greenland, 75° N.), and *bottnica* are tetraploid (n=2x7). The species which have the widest ecological and geographical range and are best equipped in the struggle for life, are to be found among the tetraploids. Pts. I and II of these studies do not contain arctic material.

Copy seen: DLC.

51495. HAGERUP, OLAF, 1889– . Studies on the significance of polyploidy, IV; *Oxycoccus*. (Hereditas, 1940. bd. 26, häfte 3–4, p. 399–410, 25 illus.) 7 refs.

Contains cytological data on this genus of small shrubs which has several closely related forms, whose chromosome numbers constitute a polyploid series, viz: n=12, n=24, and n=36. *O. microcarpus* (n=12) is a circumpolar species found farthest north in Europe, Asia, North America, which also differs ecologically

from *O. quadripetalus* var. *microphyllus* (n=2x12) of West Greenland, 66° N. The newly discovered *O. gigas* (=*O. quadripetalus* x *O. microcarpus*?) found in Sjaelland, Denmark (n=3x12) is hexaploid. Accordingly, the polyploid series attains its optimum at tetraploidy. With higher chromosome number, sexual reproduction ceases. ***Copy seen:*** DLC.

51496. HAGERUP-SVENDSEN, K. Trafikflygning över polarområdena. (Ett år i luften, flygets årsbok 1955, p. 245–58, 15 illus.) Text in Swedish. ***Title tr.:*** Civil air service over the polar regions.

Describes the first commercial flights over the polar regions carried out by Scandinavian Airlines System in 1952, and other polar flights, also the navigational requirements for flying in the Arctic. ***Copy seen:*** DLC.

51497. HAGFORS, TOR. Results of scatter measurements at 36 Mc/s over a 1,200 km. path. (*In:* Polar Atmosphere Symposium, *Oslo*, 1956. v. 2, *pub.* 1957, p. 205–209, diagrs.) 5 refs.

Some results of research by the Norwegian Defence Research Establishment on ionospheric scatter propagation over a path from southern to northern Norway are reported. Diurnal signal variation, the angular dependence of scattering cross section, the frequency dependence of scattering cross section, the frequency dependence of transmission loss, and the signal fine structure are discussed. A more or less pronounced max. in the field strength occurred in all cases at midday; for all months a min. occurred in the early evening. Particular properties of the signal found in this research may be useful for communication purposes in the Arctic. Future research requires a more detailed correlation between ionospheric condition at the control point and the scatter signal transmission loss.

51498. HAGLUND, DONN KEITH, 1926– . Brattahlid, an ancient Greenland sagastead. (American-Scandinavian review, Sept. 1957. v. 45, no. 3, p. 237–46, illus., maps.) 5 refs.

Brattahlid (now Kagsiarsuk, 61°09′ N. 45°30′ W. in the Julianehåb Distrikt) was established by Eric the Red in 986 as one of many Norse farms belonging to the settlers of Eystribygd. It included a plain of about 650 yards north-south along the Tunugdliarfik Fjord, extending 450 yards inland, and another, somewhat larger, but less fertile to the south. Eric's original home consisted of one large room, 50 by 15 ft., to which were added, over the centuries, four additional rooms and a well house. Ruins of 66 individual structures have been found, but only those of one, the larger of the two churches, have been protected. The history of the settlement, which lasted until the middle of the 15th century, is briefly reviewed. ***Copy seen:*** DLC.

51499. HAGLUND, DONN KEITH, 1926– . Greenland tourist promotion begun. (Arctic, 1957. v. 10, no. 1, p. 59.)

Notes organization in 1956 of the Turistforeningen for Grønland, its purpose: funds for construction of hotels, boats, etc., and for publicity, etc.; its membership: 1100, Greenlanders and Danes; future plans are discussed.

51502. HAGSAND, ERIK. Nordkalottmötet för jordbruksforskare år 1955. (Nordisk jordbrugsforskning, 1956. årg. 38, häfte 1, p. 3–5.) Text in Swedish. ***Title tr.:*** The North Fennoscandian

meeting for argicultural research workers 1955.

The Nordisk Jordbrugsforskning's Swedish sectional meeting at Umeå in Aug. 1955 is reviewed. Cooperation in agricultural research and its reportage was the subject of conference. A field party visited the research station under construction at Apukka, Finland, 66°35′ N., where winter wheat, rape, and other crops are grown and bogland is under cultivation. Soil temperature studies at the Pelso frost research station are mentioned. ***Copy seen:*** DA.

51503. HAHN, P., *and others.* The development of thermoregulation, 1; the development of thermoregulatory mechanisms in young rats. (Physiologia bohemoslovenica, 1956. v. 5, fasc. 3, p. 283–90, illus., table.) 13 refs. *Other authors:* J. Křeček *and* J. Křečková.

In a cold environment, rectal temperature fell quicker in 14 day-old rats than in those of 18 days; on second exposure to cold this difference was less pronounced. Relation between O_2-consumption and rectal temperature was the same in animals of identical age exposed to cold, but O_2-consumption decreased with advancing age. ***Copy seen:*** DNLM.

51504. HAHN, P. The development of thermoregulation, 2; the participation of the thyroid gland in the development of thermoregulation in rats. (Physiologia bohemoslovenica, 1956. v. 5, fasc. 3, p. 291–97, illus., table.) 18 refs.

Report on the effects of thyroidectomy, performed on the fourth and fifth day of life, upon thermoregulation. No effect was observed on the 14th day of life but on the 18th day, rate of fall in rectal temperature upon cold-exposure was significantly higher than in controls. O_2-consumption, in cold environment and for a given rectal temperature, is lower from the 18th day onwards, than in normal rats. It is concluded that the thyroid affects a newly developing mechanism of chemical thermoregulation which emerges after the 14th day of life.

51505. HAHN, P. The development of thermoregulation, 3; the significance of fur in the development of thermoregulation in rats. (Physiologia bohemoslovenica, 1956. v. 5, fasc. 4, p. 428–31, illus., table.) 5 refs. *Also pub.* in Czech in: Československá fyziologie, 1956. ročnik 5, no. 4, p. 440–43.

Report on investigation of thermoregulatory responses to cold in clipped animals of various ages. It was found that physical thermoregulation (pilomotor mechanisms) develop between the 14th and 18th day of life with additional development (of vascular mechanisms) after the 18th day. ***Copy seen:*** DNLM.

51506. HAHN, P. The development of thermoregulation, 4; carbohydrate metabolism and thermoregulation in infant rats. (Physiologia bohemoslovenica, 1956. v. 5, fasc. 4, p. 432–36, tables.) 10 refs. *Also pub.* in Czech in: Československá fyziologie, 1956. ročnik 5, no. 4, p. 444–48.

In animals older than 18 days, liver and muscle glycogen decreased upon cold-exposure. After 24 hrs. of starvation preceding cold exposure, liver glycogen fell in all age groups, but muscle glycogen only in animals over 14 days old. Starvation for 24 or 72 hrs. did not affect thermoregulation to cold.

Account of experiments with adrenalectomized, five-day old rats exposed to 30° C. It was found that their rectal temperature dropped significantly lower than that of controls. Administration of cortisone abolished the effect of adrenalectomy. ***Copy seen:*** DLC.

51508. HAHR, G. Älgskadegörelse på tallungskog. (Svenska skogsvårdsföreningen. Tidskrift, 1950. årg. 48, nr. 1, p. 24–44, illus., tables, graphs.) Text in Swedish. ***Title tr.:*** Elk damage to young pine forest.

Reports a winter (1948–49) investigation made at Bergslagen in central Sweden to determine the relationship between elk density and damage to young pine forests. Data on month-to-month weight of a young elk kept in a ¼ hectare enclosure, and its average daily consumption of pine, juniper, and birch shoots, are tabulated. From these and estimated-weight tables of freely grazing elk, the daily winter consumption of an elk over one year old is estimated to be 9–10 kg. pine, 8–9 kg. birch, and 0.5 kg. juniper shoots, or 900 kg. pine/elk/year. On two pine plots examined in spring 1949 for

elk damage, about 60% of the young trees were likely to survive. Browsing by elks is generally on 6–15-year-old trees, and is confined to shoots of the last two years, up to 4–5 mm. diam. Data on weight of branches within these limits per hectare, and on the damage (expressed as percentage of the original number of plants) for different densities of elk population are graphed. A density of not more than 3 elks/1,000 hectares, yielding 12% damage, is recommended as a suitable compromise between the different interests of forestry, hunting and wildlife conservation.

51514. HALL, SHERIDAN L. The true distance and azimuth computer for polar navigation. (Navigation, Winter 1957–58. v. 5, no. 8, p. 385–89, illus.)

Describes a simple, accurate, and time-saving device which adopts the Polar Gnomic Projection. One side of the computer is a circular slide rule which employs log sine scales and yields accurate great circle distances. The other side consists of a graphic indicator which converts measured, or map, azimuth to true course, and true bearing to plotting angle. A modified true course indicator, using only the geographic coordinates of departure and destination in computing true course, has been introduced. This indicator, as well as the distance indicator, is not restricted to any one projection, and can be used ndependent of the chart. The use of the computer is described in a sample problem. ***Copy seen:*** DLC.

51515. HALL, WILLIAM C. The strategic story of Alaska. (Military engineer, Nov.–Dec. 1957. v. 49, no. 332, p. 444–48, illus., maps.) Ref.

Reitzel, 1958. 153 p. illus., plates, maps incl. 1 fold., diagrs., tables, cross sections incl. 1 fold. (Meddelelser om Grønland,

bd. 154, nr. 3.) 85 refs. Text in German. Summary in English.
Title tr.: The "central metamorphic complex" of northeast Greenland, part 2; the geological map of the Staunings Alper and Forsblads Fjord.

Discusses in detail the stratigraphy, petrography and tectonics of the area mapped and investigated in 1954–56 by the author during the Danish Expedition to East Greenland. During the Caledonian orogeny, large sections of the sediments were progressively transformed, and all stages of this "stockwerk" folding are represented: late- to post-orogenic granite; syn-orogenic granites and migmatites; gneisses of sedimentary origin; amphibolites and related basic rocks; and late- to post-orogenic lamprophyres. Three granitic intrusions observed in the Staunings Alper massif are described and, the assumption made that the "younger granites are the direct palingenetic products of the older generation", which assumption is extended to the East Greenland Caledonide area as a whole.

(Cahiers de géographie de Québec, Oct. 1957. année 2, no. 3, p. 87–106, 3 illus., diagr., graph, table.) Approx. 50 refs. Text in French. Summary in English. ***Title tr.:*** String-bogs of subarctic Quebec-Labrador: morpho-climatic interpretation.

String-bogs are essentially marshy zones of ponds separated by strips of vegetation, the whole presenting a rectilinear or concentric pattern. They are

found in Quebec-Labrador 50°–55° N., are related to an optimum thickness of peat, and occur far south of permafrost limits in regions where snow maintains great depth. Formation of the bogs approx. 4000 B.C.–1600 A.D. is traced briefly; a combination of formative processes is suggested: sub-aquatic solifluction, gathering of isolated vegetation-covered hillocks, tearing of the plant covering by internal balls of ice, shifting of malleable peaty material, differential formation of ice in the ponds, snow action. Similar bogs are found in other parts of Canada, Alaska, Scandinavia and U.S.S.R. A brief review of the literature is given. ***Copy seen:*** DLC.

Work carried out in Dronning Louises Land (76°46′ N. 24°15′ W.) and on the northern inland ice is outlined by the expedition's chief scientist: aerial surveying, altitude of the ice surface, auroral observations, gravity determinations, glaciology, and physiology of men and dogs. Scientists involved in the work and their findings are listed. Incidence of trichinosis in the expedition's dogs was studied; insects, fish, and plants were collected. ***Copy seen:*** DLC.

51529. HAMILTON, RICHARD A., *and* **G. ROLLITT.** Climatological tables for the site of the expedition's base at Britannia Sø and the station on the inland ice, "Northice." København, C. A. Reitzel, 1957. 83 p. 3 illus., 19 tables. (Meddelelser om Grønland, bd. 158, nr. 2.)

Contains climatological tables compiled from the Expedition's meteorological observations taken over a period of about 20 months at the two stations. The meteorological equipment employed and station topography are described briefly. Monthly mean data of the following elements are tabulated: wind speed, temperature, max. and min. temperatures, relative humidity and vapor pressure, barometric pressure, and cloudiness. Extreme data are also given for temperature, pressure, relative humidity and vapor pressure. The total precipitation and the number of days with rain, snow, and gale are also given. Frequency tables are included showing diurnal variations of wind, cloud amount and, visibility, the variation of wind speed with direction, the frequency of max. temperatures, min. temperatures, and wind chill, and the variation of the state of the ground. ***Copy seen:*** DLC.

51530. HAMILTON, RICHARD A. The determination of temperature gradients over the Greenland ice sheet by optical methods. (Royal Society of Edinburgh. Proceedings, 1956–57. v. 64, pt. 4, p. 381–97, 6 tables.) 4 refs.

The experimental work was conducted during June–July 1953 at Northice at 78°04′ N. 38°27′ W. altitude 2,341 m. The temperature gradient was determined by measuring the optical refractive index of the air. Refraction was measured by observing the apparent vertical angle of each of a set of targets at distances up to 4 km. from the theodolite. The methods of calculation and selected data are given. The standard error of measurement was about .015° C./m. It is believed that the method can be sufficiently improved to measure to an accuracy of 0.1° C./m. over a range of 100 m. ***Copy seen:*** DLC.

51531. HAMILTON, RICHARD A., *and* **G. ROLLITT.** Meteorological observations at "Northice", Greenland. København, C. A. Reitzel, 1957. 45 p. tables. (Meddelelser om Grønland, Bd. 158, nr. 3.)

Contains the meteorological data obtained at the Expedition's inland ice station located at 78°04′ N. 38°29′ W. altitude 2,343 m. The surface data are given in International Code form for the period Nov. 1952–July 1954, and brief explanation of this code is included. Elements observed were: amount, kind and height of clouds; direction and velocity of wind; horizontal visibility; current and past weather; station level pressure in mb.; air temperature; precipitation; also special phenomena such as drift snow. Pilot balloon data are also tabulated for selected days during the period Mar.–Oct. 1953 and May–July 1954. ***Copy seen:*** DGS.

51532. HAMILTON, RICHARD A., *and* **H. H. LAMB.** Meteorological Office discussion: synoptic meteorology of the polar regions. (Meteorological magazine, May 1957. v. 86, no. 1019, p. 130–38, 2 text charts.) 18 refs.

Synopsis of discussion held in London, Dec. 17, 1956, led by the authors. Subjects included meteorological characteristics of arctic regions and main features of the annual heat budget; characteristics of Antarctica and comparisons between Arctic and Antarctic; change in frequency of gales at Jan Mayen; effect of water channels in arctic pack-ice on the general atmospheric circulation; katabatic winds in Greenland and depressions crossing the inland ice; observational network in the Southern Hemisphere.

51533. HAMILTON, RICHARD A. The meteorology of North Greenland during the midsummer period. (Royal Meteorological Society. Quarterly journal, Apr. 1958. v. 84, no. 360, p. 142–58, illus., tables.) 6 refs.

The meteorology of North Greenland is related to the general synoptic situation in the area. Hobbs (No. 29657) thought that Greenland weather was mainly controlled by the glacial anticyclone; Dorsey (No. 28793) showed that in southern Greenland, weather on the icecap was considerably affected by cyclonic disturbances and their associated fronts. While the glacial anticyclone is well developed in northern Greenland, that area is also subject to the passage of fronts and depressions, and, at Northice at least, the weather is the result of both cyclonic and anticyclonic systems. Synoptic situations of special interest, are illustrated by 700 mb. charts. Comparison of the 1953 and 1954 observations at Northice and at Britannia Sø, indicates that at the former station, and perhaps at the latter, the weather described may be regarded as representative of midsummer period in an average year.
Copy seen: DGS.

51534. HAMILTON, RICHARD A. The meteorology of North Greenland during the midwinter period. (Royal Meteorological Society. Quarterly journal, Oct. 1958. v. 84, no. 362, p. 355–74, 12 text maps, 2 diagrs., 10 tables.) 8 refs.

Study of: circulation at the surface and at 700 mb., air temperature, pressure, precipitation and winds, based upon data from "Northice" and Britannia Sø, for the periods Dec. 1, 1952–Jan. 31, 1953 and Dec. 1, 1953–Jan. 31, 1954. General airflow over North Greenland in midwinter is southwesterly, but near the surface of the ice sheet katabatic winds flow towards the coast. Predominantly fine weather is interrupted by the passage of depressions, but little precipitation falls. Inversions normally prevail over the ice sheet, creating temperature differences up to 25° C. Height and intensity of drift snow, wind speed, and visibility are closely related. Comparison of mean pressures and precipitation totals for the period under review with corresponding data for other stations for other years suggests that the two Januarys studied were normal months, but the two Decembers were abnormal.

51535. HAMMEL, HAROLD THEODORE, 1921– , *and others.* Heat production and heat loss in the dog at 8°–36° C. environmental temperature. (American journal of physiology, July 1958. v. 194, no. 1, p. 99–108, illus., table.) 20 refs. *Other authors:* C. H. Wyndham *and* J. D. Hardy.

Account of observations on three dogs acclimatized to 27° C. with critical temperatures of 23° to 25° C. The only physiological responses to cold observed were a moderate decrease in total heat content and an increase in heat production. Tissue conductance and cooling constant of the fur did not fall below the levels observed throughout the neutral zone. ***Copy seen:*** DLC.

51536. HAMMEL, HAROLD THEODORE, 1921– . Infrared emissivities of some arctic fauna. Ladd Air Force Base, Alaska, May 1957. 6 p. table. (U.S. Air Force. Arctic Aeromedical Laboratory. Technical report 57–25.) 7 refs.

A study of total infrared emissivities from pelts of ten arctic animals (marten, sea otter, beaver, fox, wolf, lynx, bobcat, hare, caribou, ptarmigan). They were found to be 1.0 for every species, i.e., similar to emissivities "of a perfect black body radiator." ***Copy seen:*** CaMAI.

51537. HAMMEL, HAROLD THEODORE, 1921– , *and* J. D. HARDY. Shivering only variable source of heat in intact unacclimatized dogs upon exposure to cold. (Federation proceedings, Mar. 1957. v. 16, no. 1, pt. 1, p. 54.)

Dogs kept at low temperatures (8° to 18° C.) shivered intermittently. When shivering ceased, metabolic rate (O_2-consumption) returned to levels obtained in a neutral thermal environment. This indicates that additional heat produced by unacclimatized dogs in cold environment is the product of muscular activity. ***Copy seen:*** DLC.

51538. HAMMERICH, LOUIS LEONOR, 1892– . The origin of the Eskimo. (International Congress of Americanists, 32nd. Copenhagen, 1956. Proceedings, 1958, p. 640–44.)

Applies glottochronology to locate the homeland of the Eskimos and determine the Eskimo origin of the ancient Dorset and Thule population. The heterogeneous character of Western Eskimo dialects and the uniformity of the Eastern favors the assumption of a Western origin of the Eskimos. The division of an assumed basis-language into Aleut and Eskimo, indubitably antedating the dialectal East-West separation, is considered as an added criterion for drawing "the probable center of origin of the people speaking Eskimo westwards, into the neighborhood of the Aleuts." The absence of a marked foreign layer in the present dialects of the Thule and Dorset areas is regarded as proof that the old Thule and Dorset people did speak Eskimo. ***Copy seen:*** DSI.

51539. HAMMERICH, LOUIS LEONOR, 1892– . The Russian stratum in Alaskan Eskimo. (Word, 1954. v. 10, no. 4: Slavic word, no. 3, p. 401–428.) 22 refs.

Lists and analyzes, giving Russian roots and English equivalents, about 180 Russian loan-words used in Western Eskimo: mainly concepts of religion and material culture. Approximating the extent of Russian colonization, the loan-words decrease in number towards the north, are strongest in the southwest, on Nunivak, Kodiak Islands, etc., and on the Asiatic mainland. The phonetic adaptation of Russian words to the sound patterns of different Eskimo dialects is discussed, the continued use of Russian in church services noted and the history of Russian colonization of Alaska sketched. Favorably reviewed by G. A. Menovshchikov in *Voprosy ĭazykoznaniĭa*, 1956, no. 2, p. 124–26.

51540. HAMMERICH, LOUIS LEONOR, 1892– . The Western Eskimo dialects. (International Congress of Americanists, 32nd. Copenhagen, 1956. Proceedings, 1958, p. 632–39.) Refs. in text.

Defines the territorial expansion of Western Eskimo in Alaska and Chukotka; and stresses divergence among the dialects; those of West Alaskan and Asiatic Eskimos are compared. Asiatic Eskimo is considered of Western Eskimo stock, though certain archaic features of the former point to an early separation. The presence of Russian, Spanish and English loanwords in Alaskan dialects and the paucity of old Russian (as opposed to modern Soviet) loanwords in Asiatic Eskimo are discussed. The use of some old English loanwords in Asiatic Eskimo is noted and G. A. Menovshchikov is criticized for bias in tracing the origin of loanwords. ***Copy seen:*** DSI.

51542. HANNA, FRED M. High latitude survey. (Aircraft, June 1958. v. 20, no. 6, p. 14+, illus.)

Describes the 40,000 sq. mi. Baffin Land survey in 1957 by the Photographic Survey Corp. The survey involved shoran-monitored photography for purely mapping control to be used in conjunction with subsequent complete coverage photography. Base was established at Foxe Inlet on Melville Peninsula; 85,000 gal. of aviation fuel were shipped in, supplies to the shoran stations (7) were airlifted by a DC–3. Preparations, establishment of fixed stations, and surveying procedures are described; a B–17 aircraft, equipped with shoran and an Airborne Profile Recorder, carried out the survey. ***Copy seen:*** DLC.

51543. HANNA, G. DALLAS, 1887– , *and* Mrs. **G. D. HANNA.** Miniatures of the Arctic. (Pacific discovery, May–June 1958. v. 11, no. 3, p. 12–13, illus.)

Contains photographs of tiny Alaskan arctic plants: *Marchantia, Lychnis, Salix, Papaver, Androsace, Saxifraga, Ranunculus,* and *Pedicularis;* measurements are given of the plants and, in some cases, of their flowers. ***Copy seen:*** DLC.

51544. HANNA, G. DALLAS, 1887– . Recollections of early oil exploration in Alaska. (Geological Society of America. Bulletin, Dec. 1957. v. 68, no. 12, pt. 2, p. 1905.)

Contains abstract of a paper presented at the Eighth Alaskan Science Conference in Anchorage, Sept. 10–13, 1957, describing comparatively favorable explorations up to 1938; of 64 wells drilled in the Katalla field, 21 were commercial producers. ***Copy seen:*** DGS.

51545. HANNA, G. DALLAS, 1887– . Some land shells from the Aleutian Islands, Alaska. (Nautilus, Apr. 1925. v. 38, no. 4, p. 122–25.)

Lists 13 land molluscs with notes on the distribution and habitats, collected by E. C. Van Dyke (1907) and the author (1913–1920) in the vicinity of Unalaska.
Copy seen: DSI.

51546. HANNON, JOHN P. Cardiac metabolism and function during hypothermia. (Federation proceedings, Mar. 1958. v. 17, no. 1, pt. 1, p. 66.)

Report on study of aerobic metabolism of ventricular rat tissue during hypothermia *in vitro,* compared with conditions during cooling *in vivo.* A breaking point at 21° C. was observed in both groups. Conditions above and below this point are described. ***Copy seen:*** DNLM.

51547. HANNON, JOHN P., *and others.* Effect of cold acclimatization on plasma electrolyte levels. (Journal of applied

physiology, Sept. 1958. v. 13, no. 2, p. 239–40, table.) 9 refs. *Other authors:* A. M. Larson *and* D. W. Young.

Report on a comparative assay of plasma from cold acclimatized (5° C.) and control (26° C.) rats. Significant increases were found in the levels of sodium and magnesium of the cold adapted group; no change in K, Ca, Chloride, or phosphate. ***Copy seen:*** DNLM.

51548. HANNON, JOHN P., *and* B. G. COVINO. Effect of hypothermia on the cellular respiration of ventricular tissue. (American journal of physiology, Jan. 1958. v. 192, no. 1, p. 121–25, tables.) 20 refs.

The Qo_2 of ventricular slices from hypothermic rats was significantly higher than in controls; no difference in the rate of oxidation was found when homogenates were used, except when no substrate was used or when pyruvate was added as test substrate. This and further experiments with pyruvate and malate suggest that hypothermia does not have an irreversible adverse effect on the tricarboxylic acid and associated systems, but may alter membrane permeability and/or accumulation of reduced intracellular intermediates. ***Copy seen:*** DNLM.

51549. HANNON, JOHN P. Effect of prolonged cold exposure on *in vitro* respiration and anaerobic glycolysis of rat liver. (American journal of physiology, Feb. 1958. v. 192, no. 2, p. 253–57, illus.) 9 refs.

Report on investigations of material from animals exposed to $5 \pm 1°$ C. for two to nine weeks. Cold exposure during the first four weeks was associated with increasing Qo_2 values, returning to normal after this period. Anaerobic glycolysis rate decreased progressively with the duration of cold exposure.

Copy seen: DNLM.

51550. HANNON, JOHN P., *and* D. A. VAUGHAN. Effect of prolonged consumption of pemmican survival ration on some aspects of the intermediary metabolism of rat liver tissue. (American journal of physiology, May 1958. v. 193, no. 2, p. 449–54, tables.) 15 refs.

Three to five months of feeding of pemmican raised the endogenous metabolism of liver slices and homogenates. This is attributed to an increase in the amount of readily metabolizable substrate.

51551. HANNON, JOHN P. The effect of temperature on heart rate, electrocardiogram, and certain myocardial oxidations of the rat. Ladd Air Force Base, Alaska, Mar. 1958. 18 p. illus. (U.S. Air Force. Arctic Aeromedical Laboratory. Technical report 58–3.) 14 refs.

Account of studies on rats made hypothermic by immersion in ice water and of *in vitro* studies of myocardial metabolic activity within the temperature range of 35° to 5° C. The assays indicate that the cardiac dysfunctions observed during hypothermia are attributable "to shifts in temperature kinetics of enzyme systems at 20°–21° C." ***Copy seen:*** CaMAI.

51552. HANNON, JOHN P. Effect of temperature on heart rate, electrocardiogram and certain myocardial oxidations of the rat. (Circulation research, Nov. 1958. v. 6, no. 6, p. 771–78, illus.) 15 refs.

Report on investigation of body temperature, heart rate and ECG in deeply hypothermic rats, supplemented by *in vitro* assays of myocardial metabolism at a temperature range of 5° to 35° C. The latter indicate that cardiac dysfunctions at low temperatures are attributable "to shifts in temperature kinetics of enzyme systems at 20° to 21° C."

Copy seen: DNLM.

51553. HANNON, JOHN P. Respiration of rat liver homogenates following prolonged cold exposure. (Society for Experimental Biology and Medicine. Proceedings, Feb. 1958. v. 97, no. 2, p. 368–71, illus., table.) 6 refs.

Report of investigations on liver homogenates from rats exposed to cold for about one month. An increase in endogenous metabolism was observed as well as increased rates of respiration when citrate, isocitrate, alpha-ketoglutarate, succinate, fumarate, malate, glutamate, and beta-hydroxybutyrate were present as substrates, but not in the case of a lactate substrate. Differences in magnitude and pattern of oxydation were also noted following cold exposure.

51557. HANSEN, HENRY A., *and* **U. C. NELSON.** Brant of the Bering Sea: migration and mortality. (North American Wildlife Conference, 22nd. Transactions, 1957. p. 237–56, illus., tables, map.) 26 refs.

A study on the migration, inventory and mortality of the black brant, *Branta bernicla nigricans,* based on observations in Alaska and along the Pacific coast. Egg-laying, hatching, nesting losses and brood mortality were also studied. Band returns indicate a migration from the Yukon delta to the Alaska Peninsula, thence across the ocean to the Pacific coast states, with 85% of the population wintering in California and Mexico. Population decline was found to be due to excessive hunting mortality.

Notes on the life and work of the director of Danmarks Fiskeri- og Havundersøgelser (Denmark's Fisheries and Sea Investigations), and his contributions to Greenland studies. ***Copy seen:*** DLC.

51564. HANSEN, PAUL MARINUS, 1901– . Redfish taken with the shrimp trawl in West Greenland fjords, 1952 to 1956. (International Council for the Study of the Sea. Annales biologiques 1956, *pub.* 1958. v. 13, p. 51–52, tables.)

Study based on analyses of catches from Godthåb Fjord, dead fingerlings, and specimens found in cod stomachs. Redfish in this area grow by 2–3 cm. per year, a very slow growth-rate for this species.

Copy seen: DI.

51565. HANSEN, PAUL MARINUS, 1901– . Spotted wolffish, *Anarhichas minor* and striped wolffish *Anarhichas lupus*. (International Council for the Study of the Sea. Annales biologiques, 1956, *pub.* 1958. v. 13, p. 53, illus.)

Report on experimental fishing of these species, increasingly important in Greenland fisheries since 1952. Length frequencies and weight/length relations are analyzed. ***Copy seen:*** DI.

51566. HANSEN, PAUL MARINUS, 1901– . Torskefiskeriet ved Vestgrønland og dets fremtidsudsigter. (Grønland, Apr. 1957, nr. 4, p. 121–30, illus., map.) Text in Danish. ***Title tr.:*** Cod fishing off West Greenland and its future possibilities.

Describes temperature and current conditions in West Greenland waters and biology of the Greenland cod. How the stocks will develop is impossible to foretell. Presence of warm water in quantity in 1956 and intermittent years of cod abundance are favorable signs. But more arctic species such as Greenland halibut have reappeared, in greater numbers and with wider distribution than before; cod has disappeared from its northernmost habitats, and tagged specimens have been taken in other areas; stocks have varied in recent years in Davis Strait, where the cod has been found nearer the surface for longer periods than before. ***Copy seen:*** DLC.
